Rydell, Robert W., Review of Matt Cartmill, A View to a Death in the Morning: Hunting and Nature Through History (Cambridge: Harvard University Press, 1993), Science 261 (September 17, 1993): 1609-1610. The idea that human beings are natural-born hunters is rooted less in science and nature than in culture and politics--another myth about human origins that cannot be privileged over other myths. Cartmill concludes that since boundaries between humans and animals are cultural, not natural, constructs, they must be redefined when they lose intellectual credibility. Hierarchical distinctions between masters and slaves and men and women have collapsed. If the cognitive boundary between man and beast is equally indefensible, we cannot defend human dignity without extending some sort of citizenship to the rest of nature--which means ceasing to treat the nonhuman world as a series of means to human ends (see p. 223). Rydell adds that Cartmill ought to have addressed conservation-based arguments that regard hunting as an ethical and environmentally sound means for controlling population imbalances among some species. But the book is "a razor-sharp analysis that succeeds in raising doubts about deeply rooted and widely shared assumptions concerning the position of human beings in nature." Rydell is in the Department of History, Montana State University. (Thanks to Ned Hettinger.)

Ryden, Hope, God's Dog: A Celebration of the North American Coyote. New York: Viking Press, 1979. 315 pages. The coyote is a remarkable animal. A hundred years ago it was only in the American West, but has now spread and been seen in every state except Hawaii. Every year 400,000 are exterminated in the U.S, yet the wily creature continues to flourish. There are more now in the U.S. than ever before. Rydin, Yvonne. "Can We Talk Ourselves into Sustainability? The Role of Discourse in the Environmental Policy Process." Environmental Values 8(1999):467-484. ABSTRACT: There has been a recent expansion of work within a variety of theoretical frameworks which looks at the role of discourses in policy and politics, much of it focused on environmental issues. Within this there is a particular category of polemical material which argues for discourse management and for managing discourse between actors towards achieving a particular goal, such as sustainable development. The paper examines the different ways in which the significance of environmental discourse is recognised and its influence analysed. It critically examines the claims made for normative discourse management and highlights the need to consider carefully the institutions through which environmental policy discourse is mediated. KEYWORDS: Sustainability, discourse, environmental policy, policy agendas, collaborative planning. Saayman, M. and E. Slabbert, "A Profile of Tourists Visiting Kruger National Park," Koedoe: Research Journal, South African National Parks, 47/1 (2004):1-8. Kruger is one of the world's best-known, one of the world's largest, and most profitable parks. Negotiations are underway with neighboring countries to form the Limpopo Transfrontier Conservation Area, which would be the largest park in the world. There are approximately 950,000 visitors per year. With shrinking budgets for conservation, and with growth in the number of privately owned parks, however, it is increasingly important to understand whose these tourist are and what they want in park experience. (v. 15, # 3)

Saberwal, Vasant, Rangarajan, Mahesh, and Kothari, Ashish. People, Parks and Wildlife: Towards Coexistence. Hyderabad, India: Orient Longman Limited, 2001 (Tracts for the Times #14). 143 pages. "There are two opposing ways of thinking about conservation. One is an exclusionist policy that seeks to exclude resident people from within protected areas, restrict local human access to them, and prohibit customary use rights; a policy that considers the interests of local residents as irreconcilably opposed to the logic of conservation. There is a contrary way of looking at the question, one that opposes total

exclusion, argues for the rights of resident people within the forests, and sees no ineluctable hostility between humans and animals. It is a mode of thinking that considers the politics of total exclusion to be ecologically unsound, practically unviable, and socially unjust. This tract develops the second argument against the first." Focusing on wildlands management in India, the authors saddle "exclusionists" with outmoded or extreme positions (natural systems are always in equilibrium, local interests are necessarily opposed to conservation) and fail to discuss the actual effects of subsistence use on biodiversity in a detailed or objective manner. (Contributed by Phil Cafaro). (EE v.12,#1)

Sachs, Jeffrey D., *End of Poverty: Economic Possibilities for Our Time*. New York: Penguin, 2005. An economic rescue book. Sachs proposes a much grander project than the UN's Millennium Development Goal of cutting extreme poverty in half by 2015. He wants the global economy totally to eradicate poverty by 2025. He outlines a number of "poverty traps," which doom most development projects to failure, by not considering feedback loops in the local systems. Sachs is director of the Earth Institute at Columbia University.

Sachs, Jeffrey D., "Sustainable Development," Science 304(30 April 2004):649. An editorial. With scientists, there is an overriding concern that the growing human population is putting global-scale processes under increasing strain. Larger global society is caught between competing visions of the future: one of fear and one of hope. Both acknowledge the stress, but the vision of fear sees increasing clashes over resources, with military defenses of natural resources. The vision of hope, offered often by the apprehensive scientists, holds that science and technology offer a suite of options for combining economic well-being and environmental sustainability. Sachs directs the Earth Institute at Columbia University. (v.14, #4)

Sachs, Jeffrey D. *Common Wealth: Economics for a Crowded Planet*. New York: The Penguin Press, 2008. Sachs uses economic data, demographic trends, and climate science to explore how to mitigate global warming and environmental destruction, stabilize the world's population, end extreme poverty, and break barriers such as unilateral, militarized approaches to international problems that hinder global cooperation. He argues that there are concrete, low-cost, and pragmatic remedies with benchmarks and budgets for these problems.

Sagoff, "Carrying Capacity and Ecological Economics," BioScience 45(1995):610-620. Sagoff generally argues that ecological economics is not much better than classical economics at forming a basis for environmental conservation. "I cast doubt on hopes that the utilitarian logic of ecological economics is any more able than is the logic of mainstream economics to provide a strong foundation for the claims of environmentalism" (p. 610). Reply: Daly, Herman E., "Reply to Mark Sagoff's 'Carrying Capacity and Ecological Economics,'" BioScience 45(1995):621-624. "After we have recognized the intrinsic value of the natural world, then we have an obligation to protect and increase that value. That realization leads us to pay attention to instrumental value. ... It is a further mistake to identify intrinsic value with morality and instrumental value with prudence and then set up an opposition between them, as Sagoff does." Daly's reply shows that economists, at least ecological economists, are not going to be upstaged by philosophers either on their own turf or with moralist arguments. A spirited exchange that should get the reader (or the classroom) thinking. Sagoff is at the Institute for Philosophy and Public Policy, Daly in economics, at the University of Maryland. (v7,#1)

Sagoff, Mark, "Zuckerman's Dilemma: A Plea for Environmental Ethics." Hastings Center Report 21(September-October 1991):32-40. Zuckerman is the farmer in Charlotte's Web who has to decide whether to put Wilbur, the pig, to economic use or to spare the pig for aesthetic and moral reasons. We can value nature (1) for the pork chops it provides, or (2) as an object of knowledge and perception, or (3) with love and affection. "Maryland's former director of tidal fisheries, recognizing the benefits of genetic engineering, argued that the Chesapeake Bay 'should be run more like a farm than a wilderness'" (p. 35). In such a mariculture, people might want to engineer fish that can stand the pollution and still be edible rather than remove the pollution. This might be more cost effective. A rockfish, already perfected, that does not migrate into toxic areas illustrates the possibilities. Also, fishery biologists have developed an acid tolerant trout that does well in acidified lakes. But, in environmental ethics, "the grand diversity of life, particularly the existence of rare and exotic species, presents a profound moral obligation for civilization, which is to share the earth peaceably with other species" (p. 38). Sagoff is director of the Institute for Philosophy and Public Policy, College Park, Maryland.

Sagoff, Mark, "Has Nature a Good of Its Own?" Pages 57-71 in Robert Costanza, Bryan G. Norton, and Benjamin D. Haskell, eds., Ecosystem Health: New Goals for Environmental Management. Washington, DC: Island press, 1992. If we are to accept the idea that ecosystems may be objects not only of use but also of aesthetic appreciation and moral attention, then we must accept the possibility that these systems

have a good of their own we ought to respect and therefore protect. ... Concepts of ecological health and integrity ... make the most sense in relation to the intrinsic--the moral and aesthetic value of ecological communities and systems. Sagoff is at the Institute for Philosophy and Public Policy, University of Maryland. (v5,#4)

Sagoff, Mark, "Four Dogmas of Environmental Economics," Environmental Values 3 (1994): 285-310. Four dogmas have shaped modern neoclassical economics. The first proposes that markets may fail to allocate resources efficiently, that is, to those willing to pay the most for them. The second asserts that choices, particularly within markets, reveal preferences. The third is the assumption that people always make the choices they expect will benefit them or enhance their welfare. The fourth dogma holds that perfectly competitive markets will allocate resources to their most beneficial uses. This is the doctrine of "the invisible hand." Sagoff argues that these dogmas of applied welfare economics should be abandoned. One consequence of doing so will be an increased interest in the institutional context of production. A second will be a turn toward empiricism. (v5,#4)

Sagoff, Mark, "On the Value of Endangered and Other Species," Environmental Management 20(no. 6, 1996):897-911. Two frameworks--utilitarian and Kantian--are used by society to make decisions concerning environmental management, and, in particular, species protection. The utilitarian framework emphasizes the consequences of choices for prior preferences. A perfectly competitive market, on this

model, correctly values environmental resources. The Kantian approach identifies rules appropriate to recognized situations given the identity of the decision maker. It relies on democratic political processes and institutions to provide the means by which citizens determine the identity of their community--its moral character and aspirations--and match appropriate rules to recognized situations. Markets do not fail in any general way in measuring the economic value of plants and animals. Market prices, in general, correctly represent the marginal or exchange value of species. If society legislates against extinction, this must be understood as an exercise in Kantian decision making in view of the moral value of species, not as an attempt to "correct" a market failure or to promote social welfare or utility. Sagoff is at the Institute for Philosophy and Public Policy, University of Maryland. (v8,#2)

Sagoff, Mark, "Genetic Engineering and the Concept of the Natural," Philosophy and Public Policy Quarterly 21(no. 2/3, Spring/Summer 2001):2-10. The food industry in its advertising conspicuously appeals to the image of nature and insists that all its products are natural. This has made it difficult for the industry to embrace, as it wishes, the efficiencies of genetic engineering. (v.13,#1)

Sagoff, Mark, "Muddle or Muddle Through? Takings Jurisprudence Meets the Endangered Species Act" William and Mary Law Review 38 (no. 3, March 1997):825-993. The long article takes up the entire issue and is book-length. "This Article proposes that the Supreme Court, rather than resolving controversies about the fundamental character of property, liberty, nature, ecology, and so on, appropriately limits itself to reigning in regulation at its own frontier. As long as the Court equally threatens opposing positions with utter and devastating defeat--fanning fears that it may vindicate either the libertarian or the environmentalist extreme--it may succeed in restraining the ambitions of both property owners and regulators, who then may recognize that they have more to lose from confrontation than from compromise and accommodation" (pp. 844-845). "This Article argues that no plausible scientific argument at present supports the claim that the extinction of species in the United States courts environmental disaster. It is far more plausible that rare and endangered species have become epiphenomena, affected by the environment but having little effect on it. Moral, aesthetic, and spiritual arguments amply may justify all that we do to protect every species, but an instrumental or economic rationale appears beyond reach" (p. 844). Sagoff is at the Institute of Philosophy and Public Policy at the University of Maryland, and is the former president of the International Society for Environmental Ethics. (v8,#3)

Sagoff, Mark, "Biodiversity and the Culture of Ecology," Bulletin of the Ecological Society of America 74 (no. 4, December, 1993:374-381). "What may worry us most in the disappearance of species is the prospect, then, of becoming ourselves strangers to the earth, of never quite settling into it, of losing touch with the places that help constitute the identity of our communities, of therefore being at home nowhere. For the sake of our own identities we must maintain the identities of the places where we live--and this entails maintaining its flora and fauna as well as larger landscapes. The motive for saving ecosystems may most fundamentally lie in our need to feel at home where we live--to attach ourselves to what becomes safe and secure because it retains its aesthetic and cultural characteristics in the midst of change." Sagoff is Director of the Institute for Philosophy and Public Policy, University of Maryland, and the newly elected president of ISEE. (v5,#1)

Sagoff, Mark, The Economy of the Earth: Philosophy, Law, and the Environment. Cambridge: Cambridge University Press, 1988. Pp. x, 271. Sagoff is currently Director of the Center for Philosophy and Public Policy at the University of Maryland. He concentrates on the interconnections between environmental policy, law, economics, and environmental ethics. This book is a substantially new work that draws upon many of his published articles from the period of 1974-1986. In my view, it is the single best introduction to environmental policy and environmental ethics, particularly for a sophisticated reader interested in the practical applications of scholarly philosophical thought. Sagoff provides a systematic attack on the basic assumptions of welfare economics and cost-benefit analysis as a basis for environmental policy. The idea that the aggregate of individual human preferences in the market place can serve as the basis for a just social policy is a "category mistake." Values are community based intersubjective goals which evolve throughout the history of the community, state, or nation; they cannot be reduced to consumer preferences. Contemporary policy analysts focus on a narrow model of rationality, as efficiency; but the fuller sense of rationality focuses on the virtue of deliberation, open-mindedness, and political discourse. The community-based rationality is the source of our values, ends, and goals of society; these form the basis of environmental policy. Environmental policies of preservation and conservation are not absolutes; rather they are the products of an open and rational process of community deliberation. "[E]nvironmental resources ought to be treated not as means to ends...but as ends in themselves. They are essential...to the process by which we create our values" (p. 90). For Sagoff, this process involves understanding our history as a democratic nation and our relationship with the American wilderness. This is an elegantly written book, filled with clear and precise arguments. No bibliography, but extensive notes. Reviewed in Environmental Ethics 10(1988):363-68. (Katz, Bibl # 2)

Sagoff, Mark, "Fact and Value in Ecological Science," Environmental Ethics 7(1985):99-116. An important look at the different roles that ecological science and ecologists can play in human interaction with the environment. Ecological science offers us the choice of managing the environment or preserving it. An increased awareness of ecological process will enable us to respect the integrity and value of the environment. (Katz, Bibl # 1)

Sagoff is Director of the Institute for Philosophy and Public Policy, University of Maryland. Copies are available on request: School of Public Affairs, College Park, MD 20742. Phone 301/405-4753. Fax: 301/314-9346. (v4,#2)

Sagoff, Mark, "Is Big Beautiful?" Journal of Applied Philosophy vol. 1, no. 2 (1984):269-280. A discussion of the threat to democracy posed by large scale technologies and bureaucracies, focusing on public policy in environmental affairs of the United States. (Katz, Bibl # 1)

Sagoff, Mark, "Do We Consume Too Much?" The Atlantic Monthly 279 (No. 6, June, 1997):80-96. With vigorous reply: Ehrlich, Paul R., Daly, Gretchen C., Daly, Scott C., Myers, Norman, and Salzman, James, "No Middle Way on the Environment," 280 (No. 6, December, 1997):98-104. Also see Partridge, Ernest, "How Much is too Much?" listed separately. Sagoff: "It is simply wrong to believe that nature sets physical limits to economic growth. ... The idea that increasing consumption will inevitably lead to depletion and scarcity, as plausible as it may seem, is mistaken both in principle and in fact" (p. 83). Such beliefs come from mistaken beliefs that mineral resources are finite, that we are running out of food and timber, we are running out of energy, and that resource consumption by the wealthy north exploits the poorer nations of south. Although our present consumption patterns cannot be sustained, better technology will help us surmount natural limits without requiring substantial changes beyond what we are willing to adopt. Shades of Julian Simon!

But Sagoff does not advocate high levels of consumption. The more significant limits to resource use and consumption are inherent in our spiritual needs for affiliation with nature and not in nature itself. "An intimacy with nature ends our isolation in the world. We know where we belong, and we can find the way home" "The question before us is not whether we are going to run out of resources. It is whether economics is the appropriate context for thinking about environmental policy" (p. 96). Sagoff thinks not. He not only has great faith in technology, he has even more faith that a people who discover themselves to be unlimited by nature will voluntarily limit themselves for spiritual communion with nature. "We consume too much when consumption becomes an end in itself and makes us lose affection and reverence for the natural world" (p. 96).

Ehrlich, the Dalys, Myers, and Salzman respond that Sagoff "has done a disservice to the public by promoting once again the dangerous idea that technological fixes will solve the human predicament" (p. 98). Sagoff misperceives his own misperceptions. Resources are finite, nature's services are threatened by consumption, prices are not reliable signals of resource scarcity, technology is no magic solution, and wealthy nations do exploit poorer nations. Sagoff's claims run counter to a statement signed by 1,500 leading scientists, including more than half of all living Nobel laureates in the sciences, as well as another statement issued by fifty-eight scientific academies, representing the global scientific community and including the U.S. National Academy, the British Royal Society, the French, German, Swedish, Russian, and Indian Academies. "Thus the very people who would produce the technological fixes in which Sagoff places such faith do not share his complacency" (p. 99). Middle-ground statements are muddled and encourage the present trajectory. "The temptation to look for the truth 'somewhere in the middle' may be dangerous folly." (EE v.12,#1)

Sagoff, Mark, "Free-Market Versus Libertarian Environmentalism," Critical Review 6, no. 2-3 (1993): 211-30. (v5,#4)

Sagoff, Mark, "Some Problems with Environmental Economics," Environmental Ethics 10(1988):55-74. A comment on the notion of "willingness-to-pay" as a valid method of assessing the economic value of the environment. The argument is based on material from Sagoff's book, The Economy of the Earth. For Sagoff, rationality is not the maximization of utility preferences but the process of deliberation in an open society. Good analogy with the duties of juries: decisions in a court are not based on "willingness-to-pay" but rather on a careful review of the evidence. (Katz, Bibl # 2)

Sagoff, Mark, "Cows are Better than Condos, or How Economists Help Solve Environmental Problems," Environmental Values 12(2003): 449-470. This essay explores three case studies that illustrate the exemplary use of economic analysis in environmental decision-making. These include: 1) the creation of

a market in tradable grazing rights in the American West; 2) a cost analysis that facilitated a negotiated rulemaking at a power plant in Arizona; and 3) a conception of production-based pollution allowances that led to an agreement for regulating Intel microprocessor production plants. The paper argues that cost-benefit analysis may be less useful than other kinds of economic analysis that can guide and inform rather than judge and second-guess the outcome of negotiated and collaborative decision-making. (EV)

Sagoff, Mark, "Ethics, Ecology, and the Environment: Integrating Science and Law," Tennessee Law Review 56(1988):77-229. Book length article, including an excellent (and provocative) treatment of current theory and issues within ecological science, in what might first be thought an unlikely place, a law journal, but this is in anticipation of integrating ecoscience into environmental policy. A nonrealist view of environmental science. Environmental policy looks to ecosystem science for help, but theoretical mathematical ecology is seldom of any use in telling us what we need to know in the complex interactions of ecosystems. Their variability thwarts the application of theory to nature. Ecosystem science does not have the time, knowledge, or resources to learn all about ecosystems, and current science is seldom realist anyway. "Mathematical population ecology has relied on very idealized assumptions that have no real relationship to the phenomena of natural history" (p. 124). Empirical models of ecosystems can be quite useful, but they are not theoretical, and only map the aspects of ecosystems that we pragmatically or practically wish to manage, preserve, or conserve. "The science of ecology finds itself in the midst of an identity crisis" (p. 153).

Objective, absolute theory is impossible and what kind of ecosystem science ecologists get depends on the goals they choose; if ecologists accentuate utilitarian management they get one kind; if they choose to appreciate values in nature ecologists will orient their studies differently and learn other things. "When models, equations, and principles that suggest prudential reasons for environmental protection prove to be unfounded or spurious, those who support them are left with little to contribute to public debate, because they have abandoned the moral and aesthetic rationale which may have motivated the search for the prudential arguments in the first place. It might be better and more honest if ecologists candidly admit the ethical and aesthetic goals that guide their research, rather than hide them under dubious or conjectural prudential and economic arguments" (p. 181). "I argue that estuaries, forests, lakes, and other ecosystems may properly be said to have a life--a natural history--and a good of their own; moreover, they may be studied scientifically in these normative terms. In presenting the thesis that ecological communities have a good of their own, I mean to take a small step toward establishing a basis for an environmental ethic. It seems plausible to argue, at least, that ecosystems may be legitimate objects of moral attention or worth in themselves if they have an objective good of their own--that is, if terms such as 'health,' 'integrity,' 'thriving,' 'well being,' or their opposites can meaningfully be predicated of them" (pp. 191-192). Sagoff is at the Center for Philosophy and Public Policy, University of Maryland. (v1,#4)

Sagoff, Mark, "Process or Product? Environmental Priorities in Environmental Management," Environmental Ethics 8(1986):121-138. Sagoff tries to affect a balance between the criteria of efficiency in the market and of environmental quality. Environmental policymakers must be aware that their decisions involve a set of popular ideals and values which consider the natural environment as an object of love as well as an object of use. A good practical application of Sagoff's well-known theories of environmental ethics, law, and the market. (Katz, Bibl # 1)

Surplus--not simply scarcity--provides a reason to preserve the natural environment. Although advances in biotechnology have made it possible to manipulate, alter, and replace ecological and evolutionary processes in order vastly to increase the production of economically valuable commodities, e.g., seafood in estuaries, the huge surpluses likely to result threaten fishing communities with the same economic depression and social dislocation that farming communities have already experienced. In this context, protecting the biological status quo not only expresses an admirable affection and respect for nature, but also makes economic sense by taking unneeded resources out of production. Sagoff is at the Center for Philosophy and Public Policy and the Center for Environmental and Estuarine Studies, University of

Maryland, College Park, MD. (EE)

Sagoff, Mark, Price, Principle, and the Environment. Cambridge: Cambridge University Press, 2004. Economics is helpful in designing institutions and processes through which people can settle environmental disputes. However, economic analysis fails completely when it attempts to attach value to environmental goods. Environmental policy responds to principles best identified and applied through political processes. Sagoff is with the Institute for Philosophy and Public Policy, University of Maryland.

Sagoff, Mark, "Do Non-Native Species Threaten The Natural Environment?," Journal of Agricultural and Environmental Ethics 18(2005):215-236. Conservation biologists and other environmentalists confront five obstacles in building support for regulatory policies that seek to exclude or remove introduced plants and other non-native species that threaten to harm natural areas or the natural environment. First, the concept of harm to the natural environment is nebulous and undefined. Second, ecologists cannot predict how introduced species will behave in natural ecosystems. If biologists cannot define harm or predict the behavior of introduced species, they must target all non-native species as potentially harmful, an impossibly large regulatory task. Third, loss of species richness may constitute harm to an environment, but introduced organisms typically, generally, and significantly add to species richness in ecosystems. If species richness correlates with desirable ecosystem properties, moreover, such as stability and productivity, as some ecologists believe, then introduced organisms, by increasing species richness, would support those desirable properties. Fourth, one may plausibly argue that extinction constitutes environmental harm, but there is no evidence that non-native species, especially plants, are significant causes of extinction, except for predators in certain lakes and other small island-like environments. Fifth, while aesthetic, ethical, and spiritual values may provide a legitimate basis for invasive species policy, biologists often cite concepts such as biodiversity and ecosystem health or integrity to provide a scientific justification. To assert that non-native species threaten biodiversity or undermine ecosystem health, however, may be to draw conceptual entailments or consequences from definitions of biodiversity and integrity that arbitrarily exclude non-native species or make the presence of exotic species a per se indicator of decline. Keywords Biodiversity - ecosystems - invasive species - plant breeding. Sagoff is at the Institute for Philosophy and Public Policy, University of Maryland, College Park, MD. A vigorous reply is: Simberloff, Daniel, "Non-native Species DO Threaten the Natural Environment!," Journal of Agricultural and Environmental Ethics 18(2005):595-607. (JAEE)

Sagoff, Mark, "Locke was Right: Nature Has Little Economic Value," Philosophy and Public Policy Quarterly 25(no. 3, summer 2005):2-11. Economic value is produced by labor; raw materials are of little economic value. If one resource runs out, technologists substitute another. "If optimists are correct--if technology will substitute between resource flows to keep prices low--then we are confronted with a dilemma: Either Nature provides so abundantly for our needs that no scarcity exists and thus no economic value is possible, or Nature provides inadequately and therefore technology develop to relieve scarcity and thus, again, Nature (economic services) has no economic value" (p. 6). Sagoff is at the Institute for Philosophy and Public Policy, University of Maryland.

Sagoff, Mark, "Intellectual Property and Products of Nature," American Journal of Bioethics 2(2002):12-13.

Sagoff, Mark, "On the Economic Value of Ecosystem Services," Environmental Values 17(2008):239-257. The productive services of nature, such as the ability of fertile soil to grow crops, receive low market prices not because markets fail but because many natural resources, such as good cropland, are abundant relative to effective demand. Even when one pays nothing for a service such as that the wind provides in pollinating crops, this is its 'correct' market price if the supply is adequate and free. The paper argues that ecological services are either too 'lumpy' to price in incremental units (for example, climatic systems), priced competitively, or too cheap to meter. The paper considers counter-examples and

objections.

Spash, Clive L., "How Much is that Ecosystem in the Window? The One with the Bio-diverse Trail," *Environmental Values* 17(2008):259-284. Ecosystems are increasingly characterised as goods and services to allow their valuation in monetary terms. This follows an orthodox economic approach to environmental values, but is also being undertaken by ecologists and conservation biologists. There then appears a lack of clarity and debate as to the model of human behaviour, specific values and decision process being adopted. Arguments for ecosystems service valuation are critically appraised and the case for a model leading to value pluralism is presented. The outcome is to identify the need for value articulating processes which involve open deliberative judgment rather than instantaneously stated preferences, concealed expert opinion and global cost-benefit analysis.

Sagoff, Mark. "Fact and Value in Ecological Science." *Environmental Ethics* 7(1985):99-116. Ecologists may apply their science either to manage ecosystems to increase the long-run benefits nature offers man or to protect ecosystems from anthropogenic insults and injuries. Popular reasons for supposing that these two tasks (management and protection) are complementary turn out not to be supported by the evidence. Nevertheless, society recognizes the protection of the "health" and "integrity" of ecosystems to be an important ethical and cultural goal even if it cannot be backed in detail by utilitarian or prudential arguments. It is a legitimate purpose of ecological science, moreover, to describe and help society preserve ecosystem "health" and "integrity," insofar as these are considered as privative qualities. Sagoff is at the Center for Philosophy and Public Policy and the Center for Environmental and Estuarine Studies, University of Maryland, College Park, MD. (EE)

Sagoff, Mark. "Some Problems with Environmental Economics." *Environmental Ethics* 10(1988):55-74. I criticize the contingent valuation method in resource economics and the concepts of utility and efficiency upon which it is based. I consider an example of this method and argue that it cannot--as it pretends--substitute for public education and political deliberation. Sagoff is at the Center for Philosophy and Public Policy and the Center for Environmental and Estuarine Studies, University of Maryland, College Park. MD. (EE)

Sagoff, Mark. Review of Property Rights and Eminent Domain. By Ellen Frankel Paul. *Environmental Ethics* 11(1989):179-89.

Sagoff, Mark. "Do We Need a Land Use Ethic?" *Environmental Ethics* 3(1981):293-308. I criticize what many economists recommend: namely, that land use regulations should simulate what markets would do were all resources fully owned and freely exchanged. I argue that this "efficiency" approach, even if balanced with equity considerations, will result in commercial sprawl, an environment that consumers pay for, but one that appalls ethical judgment and aesthetic taste. I show that economic strategies

intended to avoid this result are inadequate, and conclude that ethical and aesthetic as well as economic principles are needed to guide policies governing the use of land. Sagoff is at the Center for Philosophy and Public Policy and the Center for Environmental and Estuarine Studies, University of Maryland, College Park, MD. (EE)

Sagoff, Mark. Review of Private Property and the Constitution. By Bruce Ackerman. Environmental Ethics 1(1979):89-96.

Sagoff, Mark. *The Economy of the Earth: Philosophy, Law, and the Environment*, 2nd edition. Cambridge: Cambridge University Press, 2008. This revised edition of Sagoff's book that was first published in 1988 contains the following table of contents: (1) "Introduction," (2) "At the Shrine of Our Lady of Fatima or Why Political Questions Are Not All Economic," (3) "The Allocation and Distribution of Resources," (4) "Values and Preferences," (5) "Can We Put a Price on Nature's Services?," (6) "Do We Consume Too Much?," (7) "Is an Environmental Ethic Compatible with Biological Science?," (8) "Settling America or the Concept of Place in Environmental Ethics," (9) "Natural and National History," and (10) "Environmentalism: Death and Resurrection."

Sagoff, Mark. "Environmentalism: Death and Resurrection." *Philosophy and Public Policy Quarterly* Vol. 27, no. 3/4 (Summer/Fall 2007): 2-9. "Because it is now caught up in a debate among environmental scientists, environmentalism has slipped from a popular spiritual or cultural cause and has become an academic research program.... The belief that ecosystems exhibit a hidden design... unites theoretical ecology with the tradition of 'Great Chain of Being' cosmology associated with philosophers of nature from neo-Platonic mystics to 'deep ecologists today.... More recently, however, many ecologists have come to question whether the concept 'ecosystem' or 'ecological community' refers to anything that has any general design ecologists can study.... The environmental movement is dying because it expects science to maintain our faith in the rightness of nature and wrongness of humanity." Nevertheless, Sagoff expects a resurrection when environmentalists reach out to the populist constituencies who gave them support decades ago: birders, hunters, anglers, backpackers, and religious persons who recognize a religious duty to care for creation.

Sagoff, Mark. "Environmentalism: Death and Resurrection." *Philosophy and Public Policy Quarterly* Vol. 27, no. 3/4 (2007): 2-9. "Environmentalism has slipped from a popular spiritual or cultural cause and has become an academic research program." "But the spirit of environmentalism ... might rise again." Sagoff is at the Institute for Philosophy and Public Policy at the University of Maryland.

Sagoff, Mark. "Can Environmentalists Keep Two Ideas in Mind and Still Function?" *Philosophy and Public Policy Quarterly* Vol. 27, no. 1/2 (Winter/Spring 2007): 2-7. "An intelligent society can hold two opposed ideas of nature ... in mind ... without trying to make them commensurable or reducing or collapsing either into the other." One idea is nature as creation, sacred, and a source of meaning; the other idea is nature as resources to be developed for human benefit. Sagoff essentially recreates the debate between Muir and Pinchot. Sagoff is at the Institute for Philosophy and Public Policy at the University of Maryland.

Saito, Yuriko. "Ecological Design: Promises and Challenges." In recent decades, designers, architects, and landscape architects concerned with their contribution to today's ecological problems started formulating a new way of designing and creating artifacts. Called "ecological design" and promoted as a corrective alternative to conventional practice, its basic tenet is to draw from nature a guidance for design, rather than imposing our design on nature. This new approach signifies a welcome change, first by calling attention to the ecological implications of artifacts, a subject matter generally neglected in environmental ethics, and, second, by providing useful, specific suggestions regarding the ecologically responsible way of designing artifacts. However, the conceptual basis and resultant implications of ecological design deserve and need critical analyses. I argue that the basic premise of ecological design—that nature should act as the authority—is problematic by examining analogous strategies from social, political, moral, and aesthetic realms, as well as by exploring its specific application in the promotion of "native" plants in gardens. I end with another issue often neglected in the practice of ecological design: our aesthetic response to the created objects. Environmental Ethics 24(2002):243-261. (EE)

Saito, Yuriko. "Appreciating Nature on Its Own Terms." Environmental Ethics 20(1998):135-49. I propose that the appropriate appreciation of nature must include the moral capacity for acknowledging the reality of nature apart from humans and the sensitivity for listening to its own story. I argue that appreciating nature exclusively as design is inappropriate to the extent that we impose upon nature a preconceived artistic standard as well as appreciation based upon historical/cultural/literary associations insofar as we treat nature as a background of our own story. In contrast, aesthetic appreciation informed by our attempt to make sense of nature, such as science, mythology, and folklore, is appropriate because it guides our experience toward understanding nature's own story embodied in its sensuous surface. Saito is at the Rhode Island School of Design, Providence, RI. (EE)

Salleh, Ariel Kay, "Deeper than Deep Ecology: The Eco-feminist Connection," Environmental Ethics 6(1984):339-345. The first article to appear in this journal on the subject of ecofeminism. Salleh criticizes Deep Ecology for not being radical enough in its attack on the dominant Western attitudes regarding nature; it is grounded in antifeminist patriarchal modes of thought. This is a provocative and interesting idea, as later articles by other authors will show (see Environmental Ethics 1985-87). But Salleh's tone is too stringent and her argument too incomplete to be convincing. (Katz, Bibl # 1)

Salleh, Ariel K., "Epistemology and the Metaphors of Production: An Eco-Feminist Reading of Critical Theory." Studies in the Humanities 15 (1988): 130-139. Examination of the connections between the forces of production, the domination of women, and the ecological crisis. Patriarchal production of objects is, in part, the result of the inability to "reproduce"---this inability leads to an instrumental rationality destructive of the natural world. (Katz, Bibl # 2)

Salleh, Ariel Kay. "The Ecofeminism/Deep Ecology Debate." Environmental Ethics 14(1992):195-216. I discuss conceptual confusions shared by deep ecologists over such questions as gender, essentialism, normative dualism, and eco-centrism. I conclude that deep ecologists have failed to grasp both the epistemological challenge offered by ecofeminism and the practical labor involved in bringing about social change. While convergencies between deep ecology and ecofeminism promise to be fruitful, these are celebrated in false consciousness, unless remedial work is done. Salleh is an ecofeminist activist and theorist in New South Wales, Australia. (EE)

Salleh, Ariel Kay. "Deeper than Deep Ecology: The Eco-Feminist Connection." Environmental Ethics 6(1984):339-45. I offer a feminist critique of deep ecology as presented in the seminal papers of Naess and Devall. I outline the fundamental premises involved and analyze their internal coherence. Not only are there problems on logical grounds, but the tacit methodological approach of the two papers are inconsistent with the deep ecologists' own substantive comments. I discuss these shortcomings in terms of a broader feminist critique of patriarchal culture and point out some practical and theoretical contributions which eco-feminism can make to a genuinely deep ecology problematic. Salleh is an ecofeminist activist and theorist in New South Wales, Australia. (EE)

Salleh, Ariel Kay. "Class, Race and Gender Discourse in the Ecofeminism/Deep Ecology Debate."

Environmental Ethics 15(1993):225-44. While both ecofeminism and deep ecology share a commitment to overcoming the conventional division between humanity and nature, a major difference between the two is that deep ecology brings little social analysis to its environmental ethic. I argue that there are ideological reasons for this difference. Applying a sociology of knowledge and discourse analysis to deep ecological texts to uncover these reasons, I conclude that deep ecology is constrained by political attitudes meaningful to white-male, middle-class professionals whose thought is not grounded in the labor of daily maintenance and survival. At a micro-political level, this masculinist orientation is revealed by an armory of defensive discursive strategies and techniques used in deep ecological responses to ecofeminist criticism. Salleh is an ecofeminist activist and theorist in New South Wales, Australia. (EE)

Salthe, Stanley N., and Barbara M. Salthe. "Ecosystem Moral Considerability: A Reply to Cahen." Environmental Ethics 11(1989):355-61. Appeals to science as a help in constructing policy on complex issues often assume that science has relatively clear-cut, univocal answers. That is not so today in the environmentally crucial fields of ecology and evolutionary biology. The social role of science has been as a source of information to be used in the prediction and domination of nature. Its perspectives are finely honed for such purposes. However, other more conscientious perspectives are now appearing within science, and we provide an example here in rebuttal to the claim that there is no warrant from within ecology for ecosystem moral considerability. S. Salthe is at the Biology department, Brooklyn College, Brooklyn, NY. (EE)

Salthe, Stanly N. and Barbara M. Salthe, "Ecosystem Moral Considerability: A Reply to Cahen," Environmental Ethics 11(1989):355-361. This article is a criticism of Harley Cahen, "Against the Moral Considerability of Ecosystems," Environmental Ethics 10 (1988):195-216. Cahen uses only one perspective in ecological theory, the reductionist community school. The authors argue that systems ecology can provide a model for ecosystemic considerability. (Katz, Bibl # 2)

Saltz, David, "Wildlife Management," Encyclopedia of Biodiversity 5: 823-830. Wildlife management is the science of manipulating wild populations to achieve a specific goal. Five major goals of wildlife management can be recognized: 1. Maximizing harvest/yield over time. 2. Preventing extinction and increasing survival probability. 3. Maintaining and managing the integrity of ecosystems and landscapes of which wildlife populations are a part. 4. Controlling wildlife to minimize damage to human crops and assets caused by wild populations. 5. Managing wildlife to return the ecosystem to some predetermined state. (v.11,#4)

Samways, David, Ecological Wisdom and the Noble Savage: Assessing the Foundations of Eco-fundamentalism, 1996, University of Essex, UK, Ph.D. thesis in philosophy. 799 pages. Eco-fundamentalism attempts to establish incontestable foundations to environmental ethics, for example mobilizing a conception of human nature as the ultimate ground to ethical discourse. Such thinkers oppose the "ecological wisdom" of primitive peoples and the environmental degradation of civilization, with its anthropocentric orientation. But the simple equation of a certain orientation toward nature and consequent action is naive. Anthropocentrism has not been uniformly despotic, and it represents an unlikely candidate for the root cause of environmental degradation. Further, the ecological harmony of primitive peoples is a myth that owes more to Rousseauian speculation about the Noble Savage than any thoroughgoing anthropology or palaeo-anthropology. The ecological degradation caused by "developed" societies compared to primitive societies is quantitative rather than qualitative. Environmental ethics ultimately are no more than the beliefs and preferences of environmentalists. A pragmatist morality with a "medium strength anthropocentrism" can provide radical environmental ethics. (v.10,#1)

Samways, Michael J., "The Art of Unintelligent Tinkering," Conservation Biology 10(1996):1307. Will the new self-manipulating human genome slow the natural evolution of biodiversity? Genetic engineering is likely to have unanticipated consequences, whether we are tinkering with other genomes or with our own. "Perhaps the looming issue is how to build into our new genome an environmental ethic." Samways is in zoology at the University of Natal, South Africa, and has written on the ethics of insect conservation. (v8,#1)

Samways, Michael J., "A conceptual model of ecosystem restoration triage based on experiences from three remote oceanic islands," Biology and Conservation 9(2000):1073-1083. Abstract. A conceptual model, that illustrates restoration, ecological landscaping, rehabilitation and greening, is developed. It considers biocentric, historical, aesthetic and engineering aspects. The term, ecosystem restoration triage is used because the first step is to decide whether to 'do nothing' (because, on the one hand, the system is too degraded to warrant restoration, or, on the other, because biological integrity is relatively intact and therefore either none, or minimal, restoration is required) or to 'do something' (because restoration is worthwhile, urgent and feasible). This approach hinges on the definition that restoration in the strictest sense is a biocentric activity that returns the 'original' compositional, structural and functional diversity, along with its dynamics and natural evolutionary potential. 'Original' is a difficult qualifier as it depends on just how far back in time we go. Where human values are involved, this is not restoration in the pure sense of restoring ecological integrity, but is ecological landscaping, rehabilitation or greening.

Experience from three remote oceanic islands [Easter Island, Cousine Island (Seychelles), Marion Island (Sub-Antarctic)] and which represent near extremes of this model are used to illustrate it. Key words: conceptual model, ecosystem restoration triage, oceanic islands. Samways is at the Invertebrate Conservation Research Centre, School of Botany and Zoology, University of Natal, Pietermaritzburg, South Africa. (v.13,#1)

Samways, Michael J., Insect Conservation Biology. London: Chapman and Hall, 1994. 358 pages. Global variation in insect variety; historical trends; the development of insect conservation biology; levels of analysis; nature reserves and global warming; the fragmented landscape; the disturbed landscape; rarity; individual insect species and their conservation; insect pest control and insect conservation, with a concluding section on "insect conservation ethics" (intrinsic value of the individual insect and the species; insect utilitarian value; value of the landscape/ecosystem; the land ethic and the entomologist; priority systems). "Concern for landscape is concern for all life and its processes. This landscape approach also creates an awareness and an ethic that all landscapes are linked by biogeocycles. Insects are major interactors in the whole terrestrial biosphere and are therefore party to Gaia maintenance" (pp. 230-231). Samways is at the Invertebrate Conservation Research Centre, Department of Zoology and Entomology, University of Natal, Pietermaritzburg, South Africa. (v7,#1)

Sanders, Eli, "Renaming `Squaw' Sites Proves Touchy in Oregon," New York Times, December 11, 2004, p. A10. Under complaint from Native Americans the Oregon State Legislature in 2001 passed a law that all 170 places in Oregon that use the word "squaw" must be re-named, to avoid offense to the Native Americans. "Squaw" originally meant "woman" in Algonquin, and only later came to have pejorative meanings. But Native Americans cannot agree on the new names; there are 42 new names proposed for a Squaw Creek, some of them difficult to pronounce, some with sounds that do not exist in English. One tribal spokesman says that ease of pronunciation for English speakers is "not one of our criteria." A simple solution might be to return to original Native American names. But the Native Americans often do not remember what these were. In other cases, different tribes claim different names, and disagree about which tribe controlled the area in pre-European times. Sanderson, Steven E., "Keynote Address: Yellowstone Biennial Science Conference," Yellowstone Science 12 (no. 1, Winter 2004):5-12. Conference theme and this address compares conservation in Greater Yellowstone Ecosystem and the Serengeti in Africa, with lessons from and for other areas. Sanderson is bleak, especially about Africa. The World Parks Congress in 2003 in Durban, South Africa was "a difficult and troubling exercise, in which conservation was hardly invoked with pride." Formerly effective conservationists have sold out to a policy that insists on "no negative impact on local peoples." Poverty eradication has radically undermined conservation goals of the UN and the World Bank, although the record of such projects is dismal. "Wild nature in our time has been converted into a contested area that is debated, not in terms of nature itself, but purely in terms of economic potential." Conservation is blamed for "keeping people out and keeping people poor" although the supposed "integrated development" programs that follow solve none of the deeper problems." Sanders is President and CEO of

the Wildlife Conservation Society, associated with the Bronx Zoo. See also "The Future of Conservation," Foreign Affairs, September 2002.

Sandilands, Catriona, "Lesbian Separatist Communities and the Experience of Nature: Toward a Queer Ecology", Organization and Environment, 15, (No. 2, 2002): 131-63. Queer ecology is a cultural, political and social analysis that interrogates the relations between the social organization of sexuality and ecology. As a part of this analysis, this article explores the ideas and practices of lesbian separatist communities in southern Oregon. It considers that separatists have, since 1974, developed a distinct political-ecological culture to challenge the heterosexual, patriarchal and capitalist organization of rural North America. Although lesbian separatism was founded on essentialist constructions of gender and nature, the Oregon communities have developed, over time, a blend of lesbian principles and local environmental knowledge. This has produced a complex tradition of lesbian eco-political resistance. Organizing threads of this tradition include opening access to land and transforming relations of rural ownership, withdrawing land from patriarchal-capitalist production and reproduction, feminizing the landscape ideologically and physically, developing a gender-bending physical experience of nature, experiencing nature as an erotic partner, and politicizing rurality and rural lesbian identity. Sandilands is an associate professor in the Faculty of Environmental Studies at York University, Toronto.

Sandilands, Catriona Alison Hayward, The Good Natured Feminist: On the Subject of Ecofeminism and the Quest for Democracy, 1995, York University (Canada), Ph.D. thesis in sociology and women's studies. Ecofeminism embodies both considerable promise and numerous problems, notably its tendency to reduce feminist-ecological collaboration to "identity." This focus causes a number of difficulties, including the reduction of women and nature to their supposed "difference" from male culture. Identity politics, including ecofeminism, are understood as embodying a democratic desire; in light of the critique of identity offered by Laclau and Mouffe, it also becomes possible to retrieve that desire into a more "radical" democratic politics. Ecofeminism has a potential ability to construct a series of democratic conversations about nature, in which identities are seen as performative and potentially subversive. At the core of this democratic possibility lies a Lacanian "ethics of the Real," in which ecofeminism recognizes the unspeakability of nature; this "lack" is not only what keeps radical democratic politics from "getting it right" (thus preserving a desirable openness), but suggests an environmental ethics of human humility toward a partially-enigmatic nature. The advisor was Karen Anderson. (v.10,#1)

Sandilands, Catriona. "Desiring Nature, Queering Ethics: Adventures in Erotogenic Environments." Environmental Ethics 23(2001):169-188. The meaning of sustainability is the subject of intense debate among environmental and resource economists. Perhaps no other issue separates more clearly the traditional economic view from the views of most natural scientists. The debate currently focuses on the substitutability between the economy and the environment or between "natural capital" and "manufactured capital" a debate captured in terms of weak versus strong sustainability. In this article, we examine the various interpretations of these concepts. We conclude that natural science and economic

perspectives on sustainability are inconsistent. The market-based Hartwick-Solow "weak sustainability" approach is far removed from both the ecosystem-based "Holling sustainability" and the "strong sustainability" approach of Daly and others. Each of these sustainability criteria implies a specific valuation approach, and thus an ethical position, to support monetary indicators of sustainability such as a green or sustainable Gross Domestic Product (GDP). The conflict between "weak sustainability" and "strong sustainability" is more evident in the context of centralized than decentralized decision making. In particular, firms selling "services" instead of material goods and regarding the latter as "capital" leads to decisions more or less consistent with either type of sustainability. Finally, we discuss the implications of global sustainability for such open systems as regions and countries. Open systems have not been dealt with systematically for any of the sustainability criteria. (EE)

Sandilands, Catriona. "From Natural Identity to Radical Democracy." Environmental Ethics 17(1995):75-91. Environmentalism is traversed by a dilemma between a movement toward identity politics and the impossibility of a speaking natural subject; this dilemma calls into question both the relevance of identity politics for ecological struggle and dominant classical constructions of the subject itself. Using Lacanian-inspired insights on subjectivity, and the works of Ernesto Laclau and Chantal Mouffe on radical democracy, I investigate the alternative versions of the subject implicit in ecological discourses and suggest that it is through these alternatives that environmentalism can forge necessary alliances with other movements oriented toward human liberation. In particular, the very impossibility of a natural speaking subject suggests that the ecological project of redefining humanity's relationships to nonhuman nature(s) is always contingent on reorienting human subjectivity itself; this fact highlights the centrality of political coalition between ecological and other social movements. Sandilands is in environmental studies, York University, Ontario. (EE)

Sandin, Per, "The Precautionary Principle and the Concept of Precaution," Environmental Values 13(2004):461-475. The precautionary principle is frequently invoked in environmental law and policy, and the debate around the principle indicates that there is little agreement on what 'taking precautions' means. The purpose of the present paper is to provide an improved conceptual foundation for this debate in the form of an explication of the concept of precaution. Distinctions between precaution and two related concepts, prevention and pessimism, are briefly discussed. The concept of precaution is analysed in terms of precautionary actions. It is argued that precautionary actions are implicitly assumed to be precautionary with respect to something, and that this assumption should be made explicit. A definition of a precautionary action involving three necessary and jointly sufficient conditions (intentionality, uncertainty and reasonableness) is proposed, and the implications of this analysis for the debate on the precautionary principle are discussed. Sandlin is in philosophy, Royal Institute of Technology, Stockholm. (EV)

Sandin, Per. "Naturalness and de minimis Risk." Environmental Ethics 27 (2005):191-200. In risk management, de minimis risk is the idea that risks that are sufficiently small, in terms of probabilities, ought to be disregarded. In the context of the distinction between disregarding a risk and accepting it, this paper examines one suggested way of determining how small risks ought to be disregarded, specifically, the natural-occurrence view of de minimis, which has been proposed by Alvin M. Weinberg, among others. It is based on the idea that "natural" background levels of risk should be used as benchmarks and de minimis levels should be derived from those levels. This approach fails even if the doubtful distinction between what is natural and what is not can be upheld. (EE)

Sandler, Ronald, "Towards an Adequate Environmental Virtue Ethic," Environmental Values 13(2004):477-495. In this article I consider four concerns regarding the possibility of an environmental virtue ethic functioning as an alternative - rather than a supplement - to more conventional approaches to environmental ethics. The concerns are: (1) it is not possible to provide an objective specification of environmental virtue, (2) an environmental virtue ethic will lack the resources to provide critique of obtaining cultural practices and policies, (3) an environmental virtue ethic will not provide sufficient action-guidance, (4) an environmental virtue ethic cannot ground constraints on human activities regarding the natural environment. Each of these concerns makes a claim about the poverty of normative resources at the disposal of environmental virtue ethics. I defend a conception of environmental virtue - as a character virtue with the same normative standing as the conventional personal and interpersonal virtues - that enables an environmental virtue ethic with the wherewithal to address each of the concerns. Sandler is in philosophy and religion, Northeastern University, Boston. (EV)

Sandler, Ronald, and Judith Crane, "On the Moral Considerability of Homo sapiens and Other Species," Environmental Values 15(2006): 69-84. It is sometimes claimed that as members of the species Homo sapiens we have a responsibility to promote the good of Homo sapiens itself (distinct from the good of its individual members). Lawrence Johnson has recently defended this claim as part of his approach to resolving the problem of future generations. We show that there are several difficulties with Johnson's argument, many of which are likely to attend any attempt to establish the moral considerability of Homo sapiens or species generally. Further, even if Homo sapiens were morally considerable, this would not ground an adequate response to the problem of future generations. The sort of moral considerability that would be appropriate to Homo sapiens, or species generally, would not be as robust nor have the implications that many have supposed. (EV)

Sandler, Ronald, and Phaedra C. Pezzullo, eds. *Environmental Justice and Environmentalism: The Social Justice Challenge to the Environmental Movement*. Cambridge, MA: The MIT Press, 2007. Although the environmental movement and the environmental justice movement would seem to be natural allies, their relationship over the years has often been characterized by conflict and division. The environmental justice movement has charged the mainstream environmental movement with racism and elitism and has criticized its activist agenda on the grounds that it values wilderness over people. Environmental justice advocates have called upon environmental organizations to act on environmental injustice and address racism and classism in their own hiring and organizational practices, lobbying agenda, and political platforms. This book examines the current relationship between the two movements in both conceptual and practical terms and explores the possibilities for future collaboration.

Sandler, Ronald L., *Character and Environment: A Virtue-Oriented Approach to Environmental Ethics* (New York: Columbia University Press, 2007). Reviewed by Philip Cafaro, in *Journal of Agricultural and Environmental Ethics* 21(2008):389-393.

Sandler, Ronald. "The External Goods Approach to Environmental Virtue Ethics." *Environmental Ethics* 25(2003):279-293. If virtue ethics are to provide a legitimate alternative for reasoning about environmental issues, they must meet the same conditions of adequacy as any other environmental ethic. One such condition that most environmental ethicists insist upon is that an adequate environmental ethic provides a theoretical platform for consistent and justified critique of environmentally unsustainable practices and policies. The external goods approach seeks to establish that any genuinely virtuous agent will be disposed to promote ecosystem sustainability on the grounds that ecosystem sustainability is a necessary external good for cultivating the virtues and/or human flourishing. At most the external goods approach is able to provide an environmental ethic that in most contexts will require that any genuinely virtuous agent will have the goal of promoting a weak environmental sustainability. A better approach may be the substantive approach, which incorporates environmental concern and practice into the substance of the virtues, rather than as a boundary condition for any prospective virtue. Sandler, Ronald. *Character and Environment: A Virtue-Oriented Approach to Environmental Ethics*. New York: Columbia University Press, 2007. Virtue ethics is now widely recognized as an alternative to Kantian and consequentialist ethical theories, but moral philosophers have been slow to bring virtue ethics to bear on topics in applied ethics. Although environmental ethicists often employ virtue-oriented evaluation and appeal to role models for guidance, environmental ethics has not been well informed by

contemporary work on virtue ethics. Sandler attempts to remedy these deficiencies by bringing together contemporary work on virtue ethics with contemporary work on environmental ethics. He demonstrates the many ways that any ethic of character can and should be informed by environmental considerations. He also develops a pluralistic virtue-oriented environmental ethic that accommodates the richness and complexity of our relationship with the natural environment and provides effective and nuanced guidance on environmental issues. These projects have implications not only for environmental ethics and virtue ethics but also for moral philosophy more broadly.

Sandler, Ronald. "A Theory of Environmental Virtue." Environmental Ethics 28(2006):247-264. If claims about which character traits are environmental virtues are to be more than rhetoric, there must be some basis or standard for evaluation. This naturalistic, teleological, pluralistic, and inclusive account of what makes a character trait an environmental virtue can be such a standard. It is naturalistic because it is consistent with and motivated by scientific naturalism. It is teleological because character traits are evaluated according to how well they promote certain ends. It is pluralistic because those ends are both agent-relative and agent-independent. It is inclusive because it counts environmentally justified, environmentally responsive and environmentally productive virtues as environmental virtues. This theory of environmental virtue provides the basis for the development of a typology of environmental virtue that includes virtues of sustainability, virtues of communion with nature, virtues of respect for nature, virtues of environmental activism, and virtues of environmental stewardship. Saner, Marc A., Environmental Ethics and Biotechnology: A Test of Norton's Convergence Hypothesis, M. A. thesis in philosophy, Carleton University, Ottawa, Ont. May, 1999. Bryan Norton's convergence hypothesis asserts that environmentalists "of all stripes" can achieve consensus over environmental policy if only minimal constraints are applied to the dialogue. Norton challenges that his proposition has not been falsified as yet (as of 1997). I test the hypothesis against the dialogue over the environmental use of biotechnology (genetic engineering). I discuss the environmental ethical issues raised by biotechnology and show that the convergence hypothesis is either unreasonable--applying its constraints to a environmental policy dialogue is too restrictive for environmental radicals, or can be falsified --applying its constraints does not lessen the divergence between positions in the dialogue over biotech policy. The convergence hypothesis is an over-generalization: the global claim of "unity among environmentalists of all stripes" cannot be upheld. I discuss practical consequences of this observation--how it affects risk management (and the risk/ethics boundary), biotech risk communication, the comprehensiveness of the ecosystem health concept, and the application to international agreements. Saner, Marc A. "Biotechnology, the Limits of Norton's Convergence Hypothesis, and Implications for an Inclusive Concept of Health." Ethics and the Environment 5(2000):229-242. ABSTRACT: Bryan Norton proposes a "convergence hypothesis stating that anthropocentrists and nonanthropocentrists can arrive (it common environmental policy goals if certain constraints are applied. Within his theory he does not, however, address the consideration of nonconsequentialist issues, and, therefore does not provide an argument for the convergence between consequentialist and nonconsequentialist ethical positions. In the case of biotechnology. nonconsequentialist issues can dominate the debate in both the fields of environmental ethics and bioethics. I argue that, the convergence hypothesis must be rejected when tested against the case of biotechnology, and this limitation of convergence applies to any theory. of reconciliation within the "health" concept because the achievement and preservation of "health" emphasizes a consequentialist outlook. I conclude that an inclusive ethics for ecosystem and human health should be explicit about this limitation. (E&E)

Sanford, Melissa, "For Falcons as for People, Life in the Big City Has Its Risks as Well as Its Rewards," New York Times, June 28, 2004, p. A12. Peregrine falcons live in city canyons, as well as wild ones. After all, another name is pigeon hawk, so there is a good food supply. New York City has 15 nests; there are nests in Los Angeles. In Salt Lake City they nest near the Mormon Tabernacle. The week when the fledglings are learning to fly ("Hell Week" for falcons) is especially tough, and volunteer bird-watchers take great care to protect errant fledglings from traffic. (v. 15, # 3)

Santas, Aristotelis, "A Pragmatic Theory of Intrinsic Value," lecture at the Environmental Ethics Certificate Program, University of Georgia, March 12, 1966. An ecosystem is a dynamic, ever-changing process of interactions where parts are not passive recipients, but constantly interact. Individuals of an ecosystem can be instrumental to its growth, but never merely instrumental to the whole, only to the parts. The value of the whole must be seen as inseparable from the value of its constituent parts. No overall value sets a standard to measure all other values. It is absurd to claim, for example, that a salt marsh exists purely for the benefit of the resident crabs any more than it does for the benefit of humans; an ecosystem's value is not relative to its individual parts any more than it should be relative to the demands of a real estate contractor.

John Dewey's concept of value does not destroy intrinsic value. Not until we give up the idea that

value can exist outside of all context can we really have intrinsic value. Value is contextual; it exists as a functional relationship. Although understanding those relationships may necessitate a relational look at value, at the same time, value is independent of human existence. For example, fish have value to alligators and the salt marsh has value to the larger environment for its functions. There is no need to appeal to humans for value to exist; whether rational or sensory, value is there. Santas is professor of philosophy and environmental ethics and Coordinator of the Center for Professional and Applied Ethics at Valdosta State University, Valdosta, Georgia. (v7,#1)

Animals' Agenda 15, no. 4 (Sept. 1995): 28- . Are there noble experiments in restitution or affirmative action programs that favor some species over others? Animal rights philosophers Steve F. Sapontzis and Susan Finsen, and scientist Marc Bekoff, debate the question. (v6,#4)

Sapontzis, Steve F. "The Moral Significance of Interests." Environmental Ethics 4(1982):345-58. Several philosophers opposed to animal rights have recently sought to justify their opposition by arguing that the epistemic differences between human and animal interests (often referred to as "taking an interest" vs. "having an interest") constitute a morally significant difference. I first detail the various forms of having an interest and of taking an interest. I then evaluate the moral significance of these differences from both utilitarian and deontological viewpoints. The conclusion of this analysis is that the epistemic differences between human and animal interests are not morally significant. Sapontzis, Steve F., "Predation." Ethics and Animals, Vol. 5, no. 2 (June 1984): 27-38. The reductio ad absurdum of the animal rights position, especially as applied to environmental issues. Sapontzis argues that the prevention of predation is not in itself an "absurd" position. But most of his discussion centers on the meaning of the words "absurd" or "avoidable" or "impractical"--not on the substantive issues. A good lesson in what is wrong with analytical philosophy. (Katz, Bibl # 1)

Sapontzis, Steve F. "We Should Not Allow Dissection of Animals." Journal of Agricultural and Environmental Ethics 8(1995):181-189. This essay argues against routine dissection exercises on animals under three headings. First, attaining goals of general scientific education does not require dissection. The training of specialists, in whose vocations dissection skills are essential, could then be accomplished without killing animals specifically for the purpose of acquiring those skills. Second, killing and dissecting animals for unnecessary exercises teaches students bad attitudes toward animal life. Third, moral principles cannot justify killing and dissecting animals but not humans; consequently, such treatment of animals is prejudiced exploitation of the weak by the strong. (JAEE)

Sarewitz, Daniel, Frontiers of Illusion: Science, Technology and the Politics of Progress. Philadelphia: Temple University Press, 1996. 235 pages. Paper, \$ 19.95. An effort to draw science back into social accountability, deflating five myths (pp. 10-11):

- (1) the myth of infinite benefits, that more science and more technology will lead to more public good;
- (2) the myth of unfettered research, that any scientifically reasonable line of research into fundamental natural processes is as likely to yield societal benefit as any other;
- (3) the myth of accountability, that peer review, reproducibility of results, and other controls on the quality of scientific research embody the principal ethical responsibilities of the research system;
- (4) the myth of authoritativeness, that scientific information provides an objective basis for resolving

political disputes;

(5) the myth of the endless frontier, that new knowledge generated at the frontiers of science is autonomous from its moral and practical consequences in society.

The new paradigm Sarewitz proposes is sustainability, which, despite its flaws, has "conceptual malleability" as "an alternative to the mentality of infinite growth" (p. 193).

Sarewitz, Daniel, "Science and Environmental Policy: An Excess of Objectivity." Pages 79-98 in Frodeman, Robert, eds., Earth Matters: The Earth Sciences, Philosophy, and the Claims of Community. Upper Saddle River, NJ: Prentice-Hall, 2000. Scientists and decision makers alike tend to view the role of science in environmental policy as prescriptive. The goal is to create objective information that can cut through the morass of politics and enable wise decisions. Sarewitz claims that in the real world this happy result rarely emerges. What one finds instead are politicians using science to back their political positions. But rather than seeing this as a problem caused by politicians distorting the scientific facts for partisan purposes, Sarewitz suggests another possibility: that nature itself resists unitary characterization. The appeal to science to resolve our environmental questions thus presents us with an "excess of objectivity." Science can better serve to help us reach solutions we have set adjudicating social goals prior to the science. Sarewitz is with the Center for Science, Policy, and Outcomes, Columbia University, and long worked for the U.S. Congress in science policy. (v.12,#3)

Sarkar, Sahotra, "Thinking of Biology: Ecological Theory and Anuran Declines", Bioscience, 46(No.3, 1996):199- . (v7,#1)

Sarkar, Sahotra, Biodiversity and Environmental Philosophy. Cambridge: Cambridge University Press, 2005. Sarkar criticizes attempts to attribute intrinsic value to nature and defends an anthropocentric position on biodiversity conservation based on untraditional concepts of transformative value. As much concerned with epistemological issues as with environmental ethics. Sarkar is at the University of Texas, Austin.

Sarkar, Sahotra, "Wilderness Preservation and Biodiversity Conservation--Keeping Divergent Goals Distinct," BioScience 49(no. 5, May 1999):405-412. "In some instances, the tasks of biodiversity conservation and wilderness preservation converge, but at least as often they do not." Wilderness excludes or minimizes people on the landscape; biodiversity conservation need not. Biodiversity conservation can bring local benefits to third world peoples; wilderness seldom does. Biodiversity conservation is politically easier than is wilderness preservation. Wilderness preservation can make biodiversity conservation more difficult on non-wilderness lands. "Wilderness preservation cannot be used as a surrogate for biodiversity conservation. Indeed, wilderness preservation and biodiversity conservation may be in conflict. Biodiversity conservation can avoid contentious political issues while simultaneously promoting long-term conservation by maintaining independence and distance from wilderness preservation." With a reply letter by Philip Cafaro and Warren Platts, forthcoming in BioScience.

Sarkar is in philosophy, University of Texas, Austin. (v.10,#2)

Sarkar, Sahotra. *Biodiversity and Environmental Philosophy: An Introduction*. New York and Cambridge: Cambridge University Press, 2005. "Attempts to present a coherent anthropocentric position that nevertheless emphasizes biodiversity conservation" (p. xiii). Sarkar doubts that preservation of biodiversity can be justified economically. But biodiversity provides both aesthetic and intellectual benefits to human beings. This "transformative value" best justifies its protection. Sarkar develops a model for systematic conservation planning, with enthusiasm for "hands on" management and disdain for wilderness protection.

Sarre, Philip. "Towards Global Environmental Values: Lessons from Western and Eastern Experience." Environmental Values 4(1995):115-127. New environmental values are needed as the advanced industrial economy becomes global. Reviewing a range of values from hunter-gatherer, agricultural and industrial societies, the paper suggests that environmental value systems should ideally satisfy three criteria. They should be consistent with scientific understanding of natural systems, they should lead to practical ethical and political proposals and, crucially, they should inspire aesthetic responses of pleasure and awe. Current global value systems fall short of this ideal: Gaia has the potential to combine science and awe, but lacks humane decision criteria, while sustainable development is pragmatic but environmentally minimalist and lacks aesthetic inspiration. The short term need is to integrate different strands of current positions as Hinduism combined pre-existing views. A sequence of priorities is suggested: eliminating irreversible environmental change; stabilising population change through more equitable trade; and reconsidering the boundaries, practical and aesthetic, between society and nature. KEYWORDS: Environment, values, globalisation, sustainability, development. Sarre is in social sciences, The Open University, Milton Keynes. UK. (EV)

Sassen, Saskia, Globalization and Its Discontents: Essays on the New Mobility of People and Money. New York: New Press, 1998. 288 pages. \$ 25. Although money and people are more mobile than ever in the globalized economy, the money is really gathered in a rather few cities around the world, and the people who migrate are from developing countries in which rich countries have invested or which with they have had colonial or military dealings. These immigrants, legal and undocumented, commonly enter casual, low-skilled jobs in the U.S., Europe, or Japan in such cities, keeping wages low and providing services to the global cities, feeding a pattern of inequitable income distribution. The process of high-income "gentrification" in such global cities has been made possible by the ready supply of low income workers, especially female workers. Globalization erodes the power of national governments to regulate such developments, but this is too passively accepted. National governments may have more power than they think when they recognize how attached the transnational corporations are to a relatively few cities, where taxes and regulations may be easier to administer, and corporations have less power than supposed to flee somewhere else. Satterfield, Terre, "Emotional Agency and Contentious Practice: Activist Disputes in Old-Growth Forests," Ethos (American Anthropological Association) 32 (no. 2, 2004):233-256. Drawing on theories of identity and agency, emotions, and environmental ethics, this article demonstrates the culturally productive dimensions of emotional agency as it played out in disputes over old-growth logging. This reveals a "hot spot" where new imaginations of the future are creatively generated and explored. The morally persuasive use of emotional language and bodily practice (chaining oneself to a bulldozer) are thrown into relief as changing-inducing discourse that promotes new moral practices. Satterfield is at the Institute for Resources and Environmental Sustainability, University of British Columbia, Vancouver.

Satterfield, Theresa. "In Search of Value Literacy: Suggestions for the Elicitation of Environmental Values," Environmental Values 10(2001):331-360. This paper recognises the many contributions to work on environmental values while arguing that some reconsideration of elicitation practices is warranted. It argues that speaking and thinking about certain environmental values, particularly ethical expressions, are ill-matched with the affectively neutral, direct question-answer formats standard to willingness-to-pay and survey methods. Several indirect, narrated, and affectively resonant elicitation tasks were used to provide study participants with new opportunities to express their values. Coded results demonstrate that morally resonant, image-based, and narrative-style elicitation tasks help respondents articulate a broader range of noncost and nonutilitarian environmental values. However, it was found that elicitations of this kind are most useful when presented in a affectively subtle and noncontroversial form. Several suggestions for synthesising these methods with more structured forms (e.g., surveys, constructed preferences, etc.) are offered. Keywords: Environmental ethics and values, emotion and value, value deliberation, value elicitation methods, noneconomic value, narrative valuation, public participation. ABSTRACT: The 'business judgement rule' requires corporate directors only to act with honesty and reasonable care in the interest of shareholders. A stronger 'fiduciary' duty is required where one party requires protection from another. This paper argues that where corporations take risks with the environment, directors are fiduciaries. Stakeholders are in that case the general public, future generations and other species, which have not voluntarily accepted risk and cannot limit liability. Recognition of fiduciary duty in such cases is

consistent with recent trends in the law of equity. It would require all economic activities to move from open to closed (sustainable) systems. KEYWORDS: Corporate responsibilities, fiduciary duties, future generations. 248 Russell Hill Road, Toronto, Ontario, Canada, M4V 2T2.

Sayre, Kenneth. "Morality, Energy, and the Environment." Environmental Ethics 3(1981):5-18. Our crises of energy and of social values are causally interrelated. Our energy problems have contributed substantially to our contemporary value problems, as evident, for example, by the institution of the private automobile, which has begun to erode the very values it initially served. That our energy crisis has resulted from problems of value is illustrated by setting up a simple model of producer-consumer interaction, with egoism and hedonism as dominant principles of duty and of good respectively, and by showing that an energy crisis like the one we are currently experiencing is practically inevitable. These discussions lead to an assessment of the possible roles moral philosophy might play in confronting these two crises. Sayre is in the department of philosophy, University of Notre Dame, IN. (EE)

Sayre, Kenneth. "An Alternative View of Environmental Ethics." Environmental Ethics 13(1991):195-213. Environmental ethics continues to be dominated by an inferential view of ethical theory, according to which moral prescriptions and proscriptions are deduced from general principles, which in turn are arrived at intuitively or by some form of induction. I argue that the inferential approach contributes little to the pressing need which environmental philosophers have been attempting to address in recent decades--the need for a set of normative values actually in place within industrial society that will help preserve the environment from human destruction. I propose an alternative view according to which the aim of environmental ethics is (1) a clear understanding of how moral norms actually come to be instituted in a given society, (2) the analysis of the practical effect of such norms from an environmental perspective, and (3) an examination of the relative desirability of alternative norms in light of their environmental effects. In pursuing this aim, environmental ethics should join forces with anthropology, economics, and other areas of social science in hopes of generating a basis for empirical information about how moral norms actually operate. Such information might help persuade society at large of the importance of being guided by an environmentally sound set of normative values. Scarff, James E. "Ethical Issues in Whale and Small Cetacean Management." Environmental Ethics 2(1980):241-79. Three main ethical issues involved in the management of whales and small cetaceans are examined: ethical values concerning extinction and their implications for consumptive management regimes, the humaneness of current and feasible future harvesting techniques, and the ethical propriety of killing cetaceans for various uses. I argue that objections to human-caused extinction are primarily ethical, and that the ethical discussion must be expanded to include greater consideration of acceptable risks and problems associated with extinction due to human-caused genetic selection. Whaling methods are objectively described including death times for whales. I show that the debate on humaneness is not about the facts of the hunt, but about the appropriate standard for judging whether or not a technique is humane. Economic and ecological arguments which attempt to preempt the ethical questions are discussed and dismissed as specious. Arguments which attempt to distinguish ethically human relations with cetaceans from relations with other wildlife species are reviewed critically. Scarff is an attorney with the Whale Center, Oakland, CA. (EE)

Schaefer, Jame, Ethical Implications of Applying Aquinas' Notions of the Unity and Diversity of Creation to Human Functioning in Ecosystems. Ph.D. dissertation at Marquette University, 1994. Aquinas' ideas about the need for a diversity among creatures and how they interact to form a unity have affinity with some ecologists' perception of the makeup and functioning of ecosystems. There is an orderly and hierarchically structured dynamic whole. All creatures, including humans, are both interconnected and related to God as their creator, sustainer, and ultimate end. They are good and ought to be valued for the roles they play; ecosystems are sacramental signs of God's presence; humans ought to use creation virtuously; the misuse of ecosystems is sinful and from this humans need to be redeemed. Aquinas can help Roman Catholics in their search for an environmental ethic. Michael Duffey was the thesis director. Jame Schaefer, 3741 Koehler Drive, Sheboygan, WI 53083. (v6,#1)

Schaefer, Jame, "Appreciating the Beauty of Earth," Theological Studies 62 (March 2001):23-52. Categories used by contemporary environmental philosophers to explore esthetic appreciation for the beauty of the physical world have parallels in reflections by patristic and medieval theologians on the beauty of God's creation. A sampling of the theologians' notions yields a promising foundation for ecological ethics from a theistic perspective, especially when understood from their world view at the time the text was written, reformulated to reflect broad scientific findings about the world today, and worked creatively to identify norms for human behavior. Schaefer is in theology, Marquette University. (v.12,#4)

Schaefer, Jame, "Intrinsic-Instrumental Valuing of Earth: A Theological Framework for Environmental Ethics," Theological Studies 66(no. 4, 2005):783-814. Philosophers have struggled with value theory as one of the most recalcitrant problems for environmental ethics. Theologians can benefit from their efforts

when retrieving and reworking notions about the goodness of creation in patristic and medieval texts, particularly those by Augustine, John Chrysostom, and Thomas Aquinas. This process yields a religiously motivated rationale for intrinsic-instrumental valuing of the physical world's constituents for themselves, their relationships to one another, and their common good that can be relevant, meaningful, and helpful for responding to ecological valuation. Schaefer is in theology and directs an interdisciplinary minor in environmental ethics at Marquette University, Milwaukee.

Schaefer, Jame, "Acting Reverently in God's Sacramental World." Pages 37-90 in Eigo, Francis A., ed., Ethical Dilemmas in the New Millennium II. Villanova, Pennsylvania: Villanova University Press, 2001. (v.12,#4)

Schaefer, Jame. "The Virtuous Cooperator: Modeling the Human in an Ecologically Endangered Age," Worldviews: Environment, Culture, Religion 7.1-2 (2003): 171-195. Modeling the human in an age of ecological degradation requires at least four criteria for people who profess a religious faith. The model should be (1) rooted in religious faith tradition, (2) consistent with broad scientific findings, (3) positively relational to other beings and physical systems, and (4) descriptive about the kind of behavior that is needed. Among the works of Thomas Aquinas are various notions about the cooperation of creatures and God and teachings about the chief moral virtues of prudence, temperance, justice and fortitude that provide a starting point for developing a model of the human as a virtuous cooperator. When informed by broad contemporary scientific findings, the virtuous cooperator meets the criteria for modeling the human during our time by offering a realistic way of thinking about our species in relation to the more-than-human others that constitute our planet, a framework for acting responsibly, and the teleological motivation for making this behavior habitual. (v 14, #3)

Schaefer, Jame. "Grateful Cooperation: Cistercian Inspiration for Ecological Ethics," Cistercian Studies Quarterly 37.2 (2002): 187-203. A 12th century text that describes the site and surroundings of the Cistercian Abbey at Clairvaux conveys the observer's appreciation, respect and gratitude for the cooperative interactivity of the monks, other biota, and abiota that constitute the area. Parallel thinking can be found in contemporary philosophical discourse in which the human is considered a highly specialized, integral and responsible actor within the ecological system. When the human-in-ecosystem approach proceeds from deep faith in God, who empowers the emergence and interactivity of ecosystem interactors, the ethics of grateful cooperation inspired by the medieval text can guide humans to seek the health and well-being of their shared system as a way of cooperating with God. (v 14, #3)

Schaefer, Mark, D. James Baker, John H. Gibbons, Charles G. Groat, Donald Kennedy, Charles F. Kennel, and David Rejeski. "An Earth Systems Service Agency." *Science* Vol. 321, no. 5885 (4 July 2008): 44-45. Already two US federal agencies have missions solely directed to Earth sciences—the National Oceanic and Atmospheric Administration (NOAA) and the US Geological Survey (USGS). The National Aeronautics and Space Administration (NASA) also has many Earth observing systems. These agencies ought to merge to establish an independent Earth Systems Science Agency, which could better address serious environmental and economic challenges facing the United States.

Schalow, Frank. "Who Speaks for the Animals? Heidegger and the Question of Animal Welfare." Environmental Ethics 22(2000):259-271. I address the ethical treatment of animals from a Heideggerian perspective. My argument proceeds in two stages. First, it is necessary to develop a nonanthropocentric concept of freedom which extends beyond the sphere of human interests. Second, it is essential to show that our capacity to speak must serve the diverse ends of "dwelling," and hence can be properly exercised only by balancing the interests of animals with those of our own. Rather than point to naturalistic similarities between humans and animals (e.g., the capacity to feel pain), or even ontological ones (e.g., the shared dimension of "care" [Sorge]), the better strategy lies in expanding the scope of moral agency in a way which allows the differences between humans and animals to suggest guidelines as to why the former should exhibit benevolence toward the latter. In this way, I show that the basic percepts of Heidegger's philosophy support an ethic which can attend to, and speak in behalf of, the welfare of animals. (EE)

Schalow, Frank. *The Incarnality of Being: The Earth, Animals, and the Body in Heidegger's Thought*. Albany: State University of New York Press, 2006. Schalow examines Heidegger's concern for the materiality of the world to explore the ecological dimensions of Heidegger's thought in terms of kinship between humans and animals and the mutual interests that humans and animals have for preserving the environment.

Schama, Simon. Landscape and Memory. New York: Alfred A. Knopf, 1995. 652 pages. "How much more elaborately wrought is the framework through which our adult eyes survey the landscape. For although we are accustomed to separate nature and human perception into two realms, they are, in fact, indivisible. Before it can ever be a repose for the senses, landscape is the work of the mind. Its scenery is built up as much from strata of memory as from layers of rock. Objectively, of course, the various ecosystems that sustain life on the planet proceed independently of human agency, just as they operated before the ascendancy of Homo sapiens. But it is also difficult to think of a single such natural system that has not, for better or worse, been substantially modified by human culture. Nor is this the work of the industrial centuries. It has been happening since the days of ancient Mesopotamia. ... And it is this irreversibly modified world, from the polar caps to the equatorial forests, that is all the nature we have. ... Even the landscapes that we suppose to be most free of our culture may turn out, on closer inspection, to

be its product. And it is the argument of Landscape and Memory that this is a cause not for guilt and sorrow but for celebration" (pp 7-9). This work was once lectures at Princeton, also at Cambridge, and has been made into a BBC television series. "The best work I am familiar with describing the cultural role of nature, or the impact of 'place' on the development of a culture" -- William Hoover, Forestry, Purdue. Schama is a historian. A useful introduction, quite suitable for classroom use. Scherer is in philosophy at Bowling Green State University, Ohio, USA. (v6,#2)

Scherer, Donald, ed., Upstream/Downstream: Issues in Environmental Ethics. Philadelphia: Temple University Press, 1990. Pp. 242. This collection of original essays focuses on the combination of theoretical environmental ethics with practical policy issues. Scherer terms environmental problems "upstream/downstream" when they have direct effects on human beings and when current social organizations are unable to resolve value and policy conflicts. An examination of upstream/downstream problems leads to the development of an environmental theory of action rather than a mere theory of environmental value. The philosophers represented here thus discuss problems in the development of environmental policy theory: Ernest Partridge and Dale Jamieson investigate issues regarding future generations; Kristin Shrader-Frechette examines the use of models as a basis for policy; Daniel Barstow Magraw, James W. Nickel, and Mark Sagoff discuss issues in international and constitutional legal theory; and Bart Gruzalski and Alan Gewirth investigate notions of responsibility and assessment, particularly (in Gewirth's article) various kinds of cost-benefit analyses. "The common theme of these essays is that the environments in which we live...have outstripped older conceptions of responsible human living" (p. 18). (Katz, Bibl # 2)

Scherer, Donald. "Evolution, Human Living, and the Practice of Ecological Restoration." Environmental Ethics 17(1995):359-379. Critiques of ecological restoration have rested on the human/natural distinction. In opposition to the difficulties involved in that distinction, I provide a sketch of an evolutionary account of human existence. The instability of environments-- beyond individual human control--conditions

human life and sets the dynamic for human action. Human interdependence makes human monitoring of human interaction central. I interpret Leopold as concerned about the divergence between ecosystemic and economic value. In the face of reiterative prisoners' dilemmas arising significantly from problems of scale, the moral imperative is the creation of practices that tolerate ecosystemic degradation minimally and those only in the face of threats to human existence. Against this background, I show that the value of ecological restoration is ambivalent. Scherer is in the department of philosophy, Bowling Green State University. (EE)

Scherer, Donald. "Anthropocentrism, Atomism, and Environmental Ethics." Environmental Ethics 4(1982):115-23. By attempting to divorce attributions of value from judgments of the interest of the attributor, developing the concept of a locus of value, exploring the interconnections between the goods of individuals and the goods of populations and species, and suggesting the reasonableness of the attributions of rights to certain sorts of individuals, I try to indicate the degree to which an environmental ethic can be atomistic without being anthropocentric. Scherer is in the philosophy department, Bowling Green State University, Bowling Green, OH. (EE)

Scherer, Donald. "Between Theory and Practice." Restoration and Management Notes 12 (no. 2, Winter 1994): 184-188. Popular views on exotics, intervention, and technology are obscuring important issues in restoration. Not all migrating plant species are exotics; seeds in nature stick to animals and migrate, and one such animal is Homo sapiens. Human intervention has conditioned the character of certain environments in which certain species are well adapted, there is nothing unique about human intervention. The fact that humans use technology is a difference of degree not of kind. Restoration need not be to some pristine ecosystem free of humans, but restoration can be to a world that humans inhabit. Scherer teaches philosophy at Bowling Green State University, Ohio. (v6,#1)

Schicktanz, Silke, "Ethical Considerations of the HumanAnimal-Relationship Under Conditions of Asymmetry and Ambivalence," Journal of Agricultural and Environmental Ethics 19(2006):7-16. Ethical reflection deals not only with the moral standing and handling of animals, it should also include a critical analysis of the underlying relationship. Anthropological, psychological, and sociological aspects of the humananimal-relationship should be taken into account. Two conditions, asymmetry and ambivalence, are taken as the historical and empirical basis for reflections on the humananimal-relationship in late modern societies. These conditions explain the variety of moral practice, apart from paradoxes, and provide a framework to systematize animal ethical problems in a broader field. This allows the development of ideal relationships as moral orientation across anthropocentric or sentientistic ethical theories. These ideal relationships are called the patronage-model, the friendship-model and the partnership-model. The ethical problem of creating transgenic animals is discussed in the light of these

ideal relationships. Keywords: ambivalence - animal biotechnology - animal ethics - human animal-relationship. Silke Schicktanz is at the Institute for Ethics, History and Theory in Medicine, University of Muenster, Germany. (JAEE)

Schimmel, David, "Climate Change and Crop Yields: Beyond Cassandra," Science 312(30 June 2006):1889-90. In this contribution we point out and illustrate with many examples that oil production in non-OPEC countries will soon peak and steadily decrease thereafter. This will give the OPEC countries a great chance to increase prices. But even their oil production will maybe peak within the next ten years. Together with the increasing challenge of climate change and the improvement of renewable energy technologies this will imply a big change of the energy supply structure with influence on the whole economy. (v.11,#2)

Schinkel, Anders, "Martha Nussbaum on Animal Rights." *Ethics and the Environment* 13(no. 1, 2008):41-69. There is quite a long-standing tradition according to which the morally proper treatment of animals does not rely on what we owe them, but on our benevolence. Nussbaum wishes to go beyond this tradition, because in her view we are dealing with issues of justice. Her capabilities approach secures basic entitlements for animals, on the basis of their fundamental capacities. At the same time Nussbaum wishes to retain the possibility of certain human uses of animals, and to see them as morally justifiable. This article shows that these things do not go together with her capabilities approach to animal rights. More specifically, they clash with the attitude towards animals that Nussbaum's approach intends to foster in human beings. Anders Schinkel currently works as a postdoctoral researcher in the philosophy section of the Faculty of Psychology and Education of the Vrije Universiteit in Amsterdam, The Netherlands.

Schlickeisen, Rodger. "Protecting Biodiversity for Future Generations: An Argument for a Constitutional Amendment." Tulane Environmental Law Journal 8 (1994): 181-212. Society's need and duty to protect living nature. The emergence of scientific consensus. Society's moral responsibility to future generations. Lawmaking prejudiced against the future. The limitations of the traditional legal system. A proposed U.S. constitutional amendment: "The living natural resources in the United States are the common property of all the people, including generations yet to come. All persons and their progeny have an inalienable, enforceable right to the benefits of those resources for themselves and their posterity. The United States and every State shall assure that use of those resources is sustainable and that they are conserved and maintained for the benefit of all the people." Constitutional provisions elsewhere. Does the proposed amendment go far enough? The amendment is needed because, to the extent that elected officeholders do enact statutes to protect biodiversity, unless supplemented by a constitutional amendment, enforcement will be slow, unwieldy, and unsuccessful, especially because judicial interpretation of standing and constitutional private property rights will defeat meaningful implementation and enforcement. A plausible case, and one where the author has done his philosophical and legal homework. Schlickeisen is president of the Defenders of Wildlife. (v6,#1)

Schlossberger, Eugene, "Environmental Virtue Ethics: An Aristotelian Approach," Philosophy in the Contemporary World 8 (Number 2, Fall-Winter 2001): 15-26. This paper articulates a framework, "E," for developing ethical claims about environmental issues. "E" is a general framework for constructing arguments and working out disputes, rather than a particular theory. "E" is anthropocentric in the sense that it begins with ideas about human excellence and human interests. Arguments employing "E" suggest that we, as human beings, have certain duties regarding the environment. Since it may also be true that various duties attach to being an organism of any stripe, that nature has intrinsic value, and so forth, arguments employing E can be seen as supplementing, rather than replacing, non-anthropocentric moral arguments. Moreover, "E" is anthropocentric in its methodology but not necessarily in its results. Some accounts of human excellence yield the sorts of obligations that biocentrists advocate. Schlossberger is at Purdue University Calumet, Hammond, Indiana. (v.13,#2)

Schlosser, Eric, Fast Food Nation. New York: Houghton Mifflin, 2001. How the McDonald brothers and Harlan Sanders applied the principles of the factory assembly line to the commercial kitchen, used overworked and underpaid teenagers, created factory farms where the potatoes, beef, and chickens are grown, bypassed most federal oversight of their meatpacking plants, served customers feces with their cholesterol, insinuated itself into all aspects of children's lives, at the same time making them prone to obesity and disease. As an added bonus, strip mall development from Southern California right across the United States. McDonalds is his main focus. Schlosser is a tough critic and, readers may ask, whether he in turn needs his critics. (v.12,#4)

Schmidt, C., "On Economization and Ecologization as Civilizing Processes." Environmental Values Vol.2 No.1(1993):33-46. ABSTRACT: In this article the meaning and main phases of 'economization' as a civilizing process are outlined. It is argued that 'ecologization' of the current political-economic regime can in a certain sense be regarded as a continuation of this development. Due attention is given to social conditions which may be favourable or impedimental to an ecologization of 'the economy.' It is pleaded that environmental policies should use the so-called trickle-down effect to their advantage. KEYWORDS: Ecology, economy, historical-sociological aspects. Schmidtz, David, "When Preservationism Doesn't Preserve," Environmental Values 6(1997):327-340. ABSTRACT: According to conservationism, scarce and precious resources should be conserved and used wisely. According to preservation ethics, we should not think of wilderness as merely a resource. Wilderness commands reverence in a way mere resources do not. Each philosophy, I argue, can fail by its own lights, because trying to put the principles of conservationism or preservationism into institutional practice can have results that are the opposite of what the respective philosophies tell us we ought to be trying to achieve. For example, if the wisest use of South American rainforests is no use at all, then in that case conservationism by its own lights defers to preservationism. Analogously, if, when deprived of the option of preserving elephants as a resource, Africans respond by not preserving elephants at all, then in that case preservationism by its own lights defers to conservationism. Schmidtz, David. "Natural Enemies: An Anatomy of Environmental Conflict." Environmental Ethics

22(2000):397-408. Sometimes people act contrary to environmentalist values because they reject those values. This is one kind of conflict: conflict in values. There is another kind of conflict in which people act contrary to environmentalist values even though they embrace those values: because they cannot afford to act in accordance with them. Conflict in priorities occurs not because people's values are in conflict, but rather because people's immediate needs are in conflict. Conflict in priorities is not only an environmental conflict, but also often an economic conflict, a conflict rooted in differing economic circumstance. Such a conflict cannot be resolved as an environmental conflict unless it is also resolved as an economic one. (EE)

Schmitz, Oswald J. *Ecology and Ecosystem Conservation*. Washington, DC: Island Press, 2007. This is the second volume in the new Island Press series "Foundations of Contemporary Environmental Studies." Schmitz offers a short introduction to ecological science, with chapters on the science of ecology, climate and biodiversity, population size and carrying capacity, threatened species, biodiversity and habitat fragmentation, temporal and spatial dimensions of ecosystems, ecosystem services, protecting biodiversity and ecological function, and a science-based ecosystem conservation ethic.

Schmitz, Oswald J. "Effects of Predator Hunting Mode on Grassland Ecosystem Function." *Science* Vol. 319, no. 5865 (15 February 2008): 952-54. Predators, by affecting prey behavior, can change both plant diversity and productivity in an ecosystem. Greenness in a system with only plants is reduced by the herbivores, but carnivores restore the greenness by suppressing herbivores. Further, the degree to which carnivores roam or sit and wait for prey affects herbivore impacts on greenness. For commentary, see "Green with Complexity" by Shahid Naeem (*Science* Vol. 319, no. 5865 (15 February 2008): 913-14). Schmitz is in forestry at Yale University.

Schneider, Paul, "When a Whistle Blows in the Forest ..." Audubon, January/February 1992. A study of the fates of U. S. Forest Service employees who question the policies of their agency. There are service mandates to cut more trees, but such mandates often conflict with other mandates, in environmental legislation, for sustainable forestry, protection of endangered species, biodiversity, and ecosystem health. Employees who maintain they are obeying the law, or who maintain that they are doing what good scientific management requires, may find they have lost their jobs, or been transferred to harmless positions. The most celebrated such case is that of John Mumma, regional forester in charge of 15 national forests in Montana, northern Idaho, and parts of Washington and the Dakotas, who was forced to resign for his refusal to cut as much timber as was ordered. His resignation provoked a Congressional

investigation. "I am in shock at what's happening on the national forests," he told Congress. (v3,#3)

Schneider, Paul. The Adirondacks: A History of America's First Wilderness. New York: Henry Holt and Co., 1997. 365 pages. \$ 25 cloth. Bob Marshall's father, Louis Marshall, fought for the "forever wild" clause of New York State's constitution, the primary precedent for statutory protection of wilderness. A narrative history of the Adirondacks--the fur trade, the French and Indian Wars, land speculation schemes, mining, farming, logging, and the "forever wild" response. Schneider thinks New Yorkers are finally "mature" in their relationship to the Adirondacks. (v.9,#3)

Schnitzler, Annik, Jean-Claude Génot, Maurice Wintz and Brack W. Hale, "Naturalness and Conservation in France," *Journal of Agricultural and Environmental Ethics* 21(2008):423-436. This article discusses the ecological and cultural criteria underlying the management practices for protected areas in France. It examines the evolution of French conservation from its roots in the 19th century, when it focused on the protection of scenic landscapes, to current times when the focus is on the protection of biodiversity. However, biodiversity is often socially defined and may not represent an ecologically sound objective for conservation. In particular, we question the current approach to protecting a specific type of biodiversity that is at the basis of traditional landscape but does not value systems that are left to develop naturally (i.e., without significant human intervention). We present several examples of current attempts in France and Europe to managing traditional ecosystems and then discuss the values that exist in systems that develop naturally. We feel the latter systems often have much to offer in terms of biodiversity as well as providing important sites for the study of dynamic ecological communities in an ever-changing world. The lead author is at the Laboratory LIEBE-CNRS UMR 7146, UFR Sci F.A., University Paul Verlaine Metz, Rue du Général Delestraint, F-67070 Metz, France.

Schollmeier, Paul, "Why We Love the Land," Ethics and the Environment 2(1997):53-65. Philosophers today recognize that we love the land, but they do not explain satisfactorily why we do. Holmes Rolston, for example, argues that we find values in nature, but he does not explain why we love them. J. Baird Callicott explains why we love nature, but he does not argue that it has values in itself. I want to suggest that we feel love for the land because it is itself lovable. I agree with Rolston that an ecosystem has properties which are intrinsically valuable and inherent, but I wish to explain why we feel love for these properties. My approach rests on Aristotle's conception of friendship and its object. I argue that much as we love our friends for their sakes, so too we can love ecosystems for their sakes. A friend and an ecosystem can have qualities which are of a similar sort and make them both lovable. And, as we take a mental pleasure in seeing a friend fare well, so too we may take a mental pleasure in seeing an ecosystem function well. Schollmeier is in philosophy at the University of Nevada, Las Vegas. (E&E)

Schrock, John Richard, "Dissection," The Kansas School Naturalist vol 36, no. 3 (February 1990):3-15. "The loss of dissection, vivisection, and experimentation from public school science classes may pose a more serious threat to the intellectual and physical health of the human population than recent challenges to animal use in biomedical research. ... The absolute need for examination of real organisms in the classroom and in other science education settings is not self-evident. Indeed, a shallow and naive understanding of the learning process is used to purvey videotapes, models, computer simulations and stuffed animals as equivalent or superior to real laboratory experiences. The function of this issue of this issue of the Kansas School Naturalist is to clarify how the examination of real material is essential to all students' science literacy, and to help biology teachers 'hang tough.'" Schrock is in the Department of Biology at Emporia State University and directs the biology education program there. See also "Classroom Cut-Ups" under videotapes and item on dissection protested in issues, below. (v1,#4)

Schroeder, Christopher H., "Rights Against Risks," Columbia Law Review 86(1986):495-562. Through "Do no harm" is a basic duty, we permit technology that puts persons at risk, for example by environmental pollution. The realities of modern technology mean that we must permit some risky action, imposed on individuals who have not consented to it, and also unintentional in the objectives sought by the corporation involved, through action that raises the probability of harm for many and does in fact result in injuring, sometimes killing statistical persons. This can be consistent with a concept of

rights that places the utmost importance on the sanctity and autonomy of individuals. "A blunt lesson emerges from this analysis: certain risks can be imposed justifiably on others" (p. 553). "Some nonzero level of risk will almost certainly be taken to be acceptable because of the substantial adverse consequences attendant to any more severe levels of risk prevention" (p. 562). Schroeder is professor of law, Duke University. (v5,#4)

Schroeder, Doris, "Public Health, Ethics, and Functional Foods," *Journal of Agricultural and Environmental Ethics* 20(2007):247-259. Functional foods aim to provide a positive impact on health and well-being beyond their nutritive content. As such, they are likely candidates to enhance the public health official's tool kit. Or are they? Although a very small number of functional foods (e.g., phytosterol-enriched margarine) show such promise in improving individual health that Dutch health insurance companies reimburse their costs to consumers, one must not draw premature conclusions about functional foods as a group. A large number of questions about individual products' safety, efficacy, and affordability need to be answered before they might become an important part of the public health agenda. More importantly, though, the costs and benefits of functional foods relative to alternative mechanisms of public health improvement need to be ascertained. Alternative scenarios that warrant investigation are mainly the supply of nutraceutical ingredients in pill form targeting "at risk" groups and consumer education on diet and lifestyle. Schroeder is at the Centre for Professional Ethics, University of Central Lancashire, Preston, UK.

Schuetz, Joachim. "Sustainability, Systems and Meaning." Environmental Values 9(2000):373-382. ABSTRACT: Sustainability calls for the globe as a relevant unit of analysis, and systems thinking is an appropriate theoretical framework for this task. Yet systems thinking is employed in two contrary ways. The 'accommodating' systems approach is closely linked to the classical concept of science. It bases its credibility on the exclusion of values or any other subjective elements. The 'creative' way explicitly requires a subjectively recognised leading principle, according to which the system organises itself. Following the 'creative' approach, the paper argues that sustainability should be interpreted as a quest for conscious adoption of a global systems identity. It is this assigned system purpose that gives single actions and judgements within systems their meaning. Since subjective elements will always remain antagonistic in any classical approach, only a 'creative' approach offers possibilities for integrating cybernetic systems thinking, giving rise to a concept of systems guided by meaning. KEYWORDS: Sustainability, systems identity, meaning, artificial outside position. Schuetz resides at Obere Heslibachstr, 72, CH-8700 Kuesnacht, Switzerland. (EV)

Schull, Jonathan, "Are Species Intelligent?" Behavioral and Brain Sciences 13(1990):63-108. "Plant and animal species are information-processing entities of such complexity, integration, and adaptive competence that it may be scientifically fruitful to consider them intelligent. The possibility arises from the analogy between learning in organisms and evolution in species. Intentional and cognitive ability are now ascribed to animal, human, and artificial intelligence systems that process information adaptively, and that manifest problem-solving abilities. The structural and functional similarities between such systems and species are extensive. As biological entities, and as processors of information, plant and animal species are no less complicated than, say, monkeys. Their adaptive achievements (the brilliant design and exquisite production of biological organisms) are no less impressive, and certainly rival those of the animal and electronic systems to which the term 'intelligence' is routinely applied today. So perhaps we should recognize them as intelligent systems of considerable scope." This is a "target article," and open peer commentary follows by two dozen persons. Schull is in the Department of Psychology, Haverford College, Haverford, PA.

Schullery, Paul, Lewis and Clark Among the Grizzlies: Legend and Legacy in the American West. Helena, MT: Falcon Press, 2002. What Lewis and Clark's experiences revealed regarding the great bears and the men who encountered them. Schullery, a historian and a naturalist, well-known for his attention to Yellowstone National Park, examines the expedition's rich legacy of grizzly lore in the light of modern scientific knowledge and separates the legends from the still quite thrilling realities. "I suspect that in no other sphere were their perceptions more astute, their imaginations more challenged, and their dreams more vividly fulfilled, than in their dealings with the grizzly bear" (p. 9). (v.13,#4)

Schullery, Paul and Whittlesey, Lee, "Mountain Goats and the Greater Yellowstone Ecosystem: A Prehistoric and Historical Context," Western North American Naturalist 61(no. 3, 2001):289-307. Native mountain goats were near Yellowstone in the past but no authority has located them there previously. Some goats are now found in Yellowstone, presumably migrating from introduced populations in nearby Montana, though possibly from native populations in Idaho further away. Park policy does not welcome the goats. Both authors are with Yellowstone National Park, Yellowstone Center for Resources. (v.12,#3)

Schullery, Paul, Searching for Yellowstone: Ecology and Wonder in the Last Wilderness. Boston: Houghton Mifflin, 1997. An insightful history of trying to figure out the meaning of Yellowstone National Park. Yellowstone's "discovery" by whites followed 10,000 years of occupation and use by native Americans, and Schullery can both say that the native Americans were "very aggressive land managers" (p. 11) and, on the next page, that there is a sense in which "these Indians have left fewer enduring evidences of their occupancy than the beaver, badger, and other animals on which they

subsisted" (p. 12). A repeated theme throughout the book is that things are more complex than they seem, whether the biology, the politics, or the history. The park's founding became a creation myth for the conservation movement; the image was composed of equal parts of myth, hype, and rare glimpses of the incredible wonder of the place. Yellowstone's image as a peaceful, unchanging American wilderness is belied by a century of bitter debate over what its real purpose should be, as our continually changing relationship with nature has altered our perceptions about wild country. Now surpassing 100 million visitors, Yellowstone can become a global conscience, a barometer of the health of the planet. Schullery has served Yellowstone Park in several capacities, including park historian, chief of cultural resources, and senior editor in the Yellowstone Center for Resources. (v8,#3)

Schullery, Paul, Yellowstone's Ecological Holocaust: The Legacy of Market Hunting in the Park's First Decade," Montana: The Magazine of Western History 47(no. 3, Autumn, 1997):16-33. Elk may have always been abundant in Yellowstone National Park; competent authorities are divided over what the pre-European population was. Elk were decimated by first legal and later illegal hunting. Various management strategies have left a wildlife population that is only partially natural, yet also significantly natural, with continuing debate about how natural it is, and ought to be. Article adapted from Schullery, Searching for Yellowstone: Ecology and Wonder in the Last Wilderness, Houghton Mifflin. Schullery is with Yellowstone National Park.

Schullery, Paul, "Theodore Roosevelt: The Scandal of the Hunter as a Nature Lover." Schwartz, Barry, The Paradox of Choices. San Francisco: HarperCollins, 2004. More options make us less happy, especially in American consumerism. The more choices we ponder or the more time we invest in making a choice, the worse we tend to feel about our decision. The typical supermarket has more than 30,000 items. The author found in the market where he shops: 85 varieties of crackers, 285 of cookies, 230 different soups, 120 pasta sauces and 175 kinds of salad dressing. At some point "choice no longer liberates. It might even begin to tyrannize." Schwartz recommends "satisficing" (following Herbert Simon), choosing any one that is good enough, and forgetting about the best, or the most, or any maximizing. (v. 15, # 3)

Schwartz, Daniel, "A Rabbi's Reply: In God's Green Earth We Trust." The Washington Post, December 1, 1996, p. C2. Reply to Gelernter, David, "In Rats We Trust: Making a Moral Case Against the Tryanny of Environmentalism." The Washington Post, November 17, 1996, p. C1, C5. "Religion and science alike agree that there is a profound integrity to the fabric of life--and when we tear at that fabric, we, in the end, endanger ourselves, especially, all too often, the poor and disenfranchised of the world. There is no escaping it--factually and morally, we are part of, not apart from nature." Schwartz is rabbi at Temple Shalom in Chevy Chase, Maryland, and associate director of the National Religious Partnership for the Environment. (v.7,#4)

Schwartz, Eilon. "Bal Tashchit: A Jewish Environmental Precept." Environmental Ethics 19(1997):355-374. The talmudic law bal tashchit ("do not destroy") is the predominant Jewish precept cited in contemporary Jewish writings on the environment. I provide an extensive survey of the roots and differing interpretations of the precept from within the tradition. The precept of bal tashchit has its roots in the biblical command not to destroy fruit-bearing trees while laying siege to a warring city. The rabbis expand this injunction into the general precept of bal tashchit, a ban on any wanton destruction. Such a precept was interpreted in differing ways, along a continuum whose poles I describe as the minimalist and maximalist positions. In the minimalist position, interpreters limit the application of bal tashchit to only

those situations in which natural resources and property are no longer viewed as having any economic or aesthetic worth. In the maximalist position, interpreters expand the application of bal tashchit to any situation in which nature and property are being destroyed for something other than basic human needs. Finally, I compare and contrast the substance and style of the discussion of bal tashchit from within the Jewish tradition with the contemporary discussion of environmental ethics. Schwartz is in the School of Education, Hebrew University, Jerusalem. (EE)

Schwarz, O. Douglas. "Indian Rights and Environmental Ethics." Environmental Ethics 9(1987):291-302. The American environmental movement has a longstanding tradition of respect for American Indians. Recently, however, there has been a noticeable erosion of that tradition. The most volatile issues in the Indian/environmentalist controversy at present are those involving the right of many Indians to hunt and fish unrestricted by state or federal conservation regulations. Especially where endangered species are involved, some environmentalists have been quick to recommend that this unique privilege accorded to Indians be curtailed. While I share a deep concern for the preservation of endangered species and ecosystems, I suggest that the environmental movement has so far been insensitive to the concerns of the American Indian community. Rather than simply seeking to take away rights to which Indians have been entitled for decades, environmentalists should be prepared to negotiate on such matters. As an example, I suggest that--in exchange for the Indians' voluntary surrender of some of their treaty rights--environmentalists might agree to seek legislation opening national forest lands to Indians who wish to live subsistence life styles, as some Alaskan wilderness lands are now open to the Inuit. Schwarzschild, Steven S. "The Unnatural Jew." Environmental Ethics 6(1984):347-62. I argue that Judaism and Jewish culture have paradigmatically and throughout history operated with a fundamental dichotomy between nature ("what is") and ethics (i.e., God and man--"what ought to be"). Pagan ontologism, on the other hand, and the Christian synthesis of biblical transcendentalism and Greek incarnationism result in human and historical submission to what are acclaimed as "natural forces." Although in the history of Jewish culture such a heretical, quasi-pantheistic tendency asserted itself, first in medieval kabbalism and then in modern Zionism, from a traditional Jewish standpoint nature remains subject to humanly enacted ends. Evidence for this general thesis can be found in biblical, Talmudic, medieval philosophic, and mystical literature, in modern religious, poetic, and Zionist literature, and in the history of general philosophy. Science, 21 July, 1995, contains fourteen articles on frontiers in ecology, under the theme "Big Questions for a Small Planet." (v6,#3)

Science, 25 July 1997 (vol. 277, no. 5325) is a theme issue on "Human-Dominated Ecosystems." Contains:

--Vitousek, Peter M., Harold A. Mooney, Jane Lubchenko, and Jerry M. Melillo, "Human Domination of Earth's Ecosystems," (pp. 494-499). Human alteration of Earth is substantial and growing. Between one-third and one-half of the land surface has been transformed by human action; the carbon dioxide concentration in the atmosphere has increased by nearly 30 percent since the beginning of the Industrial Revolution; more atmospheric nitrogen is fixed by humanity than by all natural sources combined; more than half of all accessible surface fresh water is put to use by humanity; and about one-quarter of the bird species on Earth have been driven to extinction. By these and other standards, it is clear that we live on a human dominated planet.

--Chapin, III, F. Stuart, et al., "Biotic Control over the Functioning of Ecosystems," (pp. 500-504). Changes in the abundance of species--especially those that influence water and nutrient dynamics, trophic interactions, or disturbance regime--affect the structure and functioning of ecosystems. Diversity is also functionally important, both because it increases the probability of including species that have strong ecosystem effects and because it can increase the efficiency of resource use. Differences in environmental sensitivity among functionally similar species give stability to ecosystem processes, whereas differences in sensitivity among functionally different species make ecosystems more vulnerable to change. Current global environmental changes that affect species composition and diversity are therefore profoundly altering the functioning of the biosphere.

--Matson, P. A., et al, "Agricultural Intensification and Ecosystem Properties," (pp. 504-509). Expansion and intensification of cultivation are among the predominant global changes of this century. Intensification of agriculture by use of high-yielding crop varieties, fertilization, irrigation, and pesticides has contributed substantially to the tremendous increases in food production over the past 50 years. Land conversion and intensification, however, also alter the biotic interactions and patterns of resource availability in ecosystems and can have serious local, regional, and global environmental consequences. The use of ecologically based management strategies can increase the sustainability of agricultural production while reducing off-site consequences.

--Botsford, Louis, et al., "The Management of Fisheries and Marine Ecosystems" (pp. 509-515). The global marine fish catch is approaching its upper limit. The number of overfished populations, as well as the indirect effects of fisheries of marine ecosystems, indicate that management has failed to achieve a principal goal, sustainability. This failure is primarily due to incessant sociopolitical pressure for greater harvests and the intrinsic uncertainty in predicting the harvest that will cause population collapse. A more holistic approach incorporating interspecific interactions and physical environmental influences would contribute to greater sustainability by reducing the uncertainty in predictions. However, transforming the management process to reduce the influence of pressure for greater harvest holds more immediate promise.

--Dobson, Andy P., et al., A. D. Bradshaw, and A.J.M. Baker, "Hopes for the Future: Restoration Ecology and Conservation Biology" (pp. 515-522). Conversion of natural habitats into agricultural and industrial landscapes, and ultimately into degraded land, is the major impact of humans on the natural environment, posing a great threat to biodiversity. The emerging discipline of restoration ecology provides a powerful suite of tools for speeding the recovery of degraded lands. In doing so, restoration ecology provides a crucial complement to the establishment of nature reserves as a way of increasing land for the preservation of biodiversity. An integrated understanding of how human population growth and changes in agricultural practice interact with natural recovery processes and restoration ecology provides some hope for the future of the environment.

--Noble, Ian R. and Rodolfo Dirzo, "Forests as Human-Dominated Ecosystems," (pp. 522-525). Forests are human-dominated ecosystems. Many of the seemingly lightly managed or unmanaged forests are actually in use for agroforestry or for hunting and gathering. Agroforestry does reduce biodiversity, but it can also act as an effective buffer to forest clearance and conversion to other land uses, which present the greatest threat to forested ecosystems. In forests used for logging, whole-landscape management is crucial. Here, emphasis is placed on areas of intensive use interspersed with areas for conservation and catchment purposes. Management strategies for sustainable forestry are being developed, but there is a need for further interaction among foresters, ecologists, community representatives, social scientists, and economists.

--Malakoff, David, "Extinction on the High Seas" (pp. 486-488). Biologists have long assumed that the oceans are too vast, and their habitats too prolific, for humans ever to extinguish any marine species. But now that assumption is under attack. At the same time, estimates of the number of marine species are escalating, with new discoveries. Only about 275,000 marine species have actually been described, and but estimates for coral reefs alone are at least a million species, and possibly up to 9 million, with another 10 million on the deep sea's expansive floor. (v8,#3)

Science and Engineering Ethics. An international quarterly launched in January 1995, exploring ethical issues confronting scientists and engineers. Papers are invited. Editors: Stephanie J. Bird, Massachusetts Institute of Technology, Room 12-187, 77 Massachusetts Ave., Cambridge, MA 02139; or Raymond Spier, School of Biological Sciences, University of Surrey, Guildford, Surrey, GU2 5XH, U.K. (v6,#1)

Science, June 25, 1993, is a special issue devoted to "Environment and the Economy." A lead editorial complains of the "pathological growth of [environmental] regulations." Carl Sagan and Edward O. Wilson protest against having (allegedly) been "blacklisted" by Science because their advocacy prejudices their scientific credibility. Articles: "Protecting the Environment with the Power of the Market," "Is

Environmental Technology a Key to a Healthy Economy?" "Can Sustainable Farming Win the Battle of the Bottom Line? Few Options for Third World Farmers," "How to Make the Forests of the World Pay Their Own Way," and "Wetlands Trading is a Loser's Game Say Ecologists: Bringing Vanished Wetlands to Life," (i.e. mitigation doesn't work). (v4,#2)

Science of the Total Environment, The, 184, Nos. 1-2 (17 May 1996) is a special issue on "Ethical and Philosophical Issues in Environmental Epidemiology" and was guest edited by Colin Soskolne and Roberto Bertolini. Philosophers with articles in the issue include: Holmes Rolston III, Laura Westra, Dale Jamieson, Earl R. Winkler, and Andrew Light. (v7, #3)

Scientific American. September 1989, vol. 261, no. 3, is a special issue devoted to "Managing Planet Earth." Eleven articles are on atmosphere, climate, water, biodiversity, population, agriculture, manufacturing, sustainable development, and a sustainable world. The issue can be ordered from Scientific American, Dept. MPE, 415 Madison Ave., New York, NY 10017, for \$ 6.00. Phone 212/754-0550. (v1,#1)

Scotland's Hills and Mountains: A Concordat on Access, with commentaries by Andrew Raven, A. R. Gillingham, and Nick Kempe. John Muir Trust Journal and News (Edinburgh), no. 21, July 1996, pp. 18-24. The rights and responsibilities of hillwalkers and climbers regarding access to the Scottish hills and mountains is addressed in this concordat, launched by the Scottish Agriculture and Environment Minister and signed last January by various parties. At issue is increasing pressure for public access to the often privately held Scottish lands, including whether current access without the explicit consent of the owner involves trespass under existing law. The Concordat comes in the face of commitment of the Labour Party in England and Wales to access legislation, where trespass laws are more harsh, and the question whether such legislation is necessary in Scotland or can be addressed by voluntary agreement. "Freedom of access is a moral right and freedom of movement is recognised by the United Nations as a fundamental human right: if it is to mean anything, in this overregulated and frantic society in which we live, it should include the freedom to enjoy the hills and mountains and not be restricted to use of public roads" (Nick Kempe, p. 24). Compare the "everyman's right" of the Scandinavian countries. (v7, #3)

"We believe that scientists and professional societies should strive to conduct policy-relevant science, to report it in value-neutral language, to state clearly the policy implications of the findings, and to be vigorous in their efforts to bring that information to the attention of decision makers and all interested parties."

Scott, Peter, "Types of Ecotheology," *Ecotheology* 4(1998):8-19. Provincialist (or confessional) ecotheologies draw heavily on Christian doctrinal resources. Secularist (or reconstructive) ecotheologies reinterpret Christianity in terms of new, worldly knowledge. Both can be either modernizing or anti-modernizing, yielding a four-fold typology. This typology can identify the doctrinal resources employed, the importance invested in the core doctrines of Christianity, the issue of "natural theology," the metaphysical issue of the relation between humanity and nature, and the hermeneutical significance of the context of modernity for the interpretation of nature. The typology is applied to various contemporary ecotheologists. Oelschlaeger's typology is found inadequate. Scott teaches theology at Cheltenham and Gloucester College of Higher Education, UK. (v.10,#1)

Scott Peter, "Types of Ecotheology," *Ecotheology* No 4 (Jan 1998):8-9.

Scott, Peter, "Blessing and Curse: 'The Natural' as a Theological Concept," *Modern Believing* 38 (no. 4, 1997):15-23. Liberal humanism has lost any sustained sense of human naturalness. Modernism tries to escape the limitations and context of our natural origins. Christianity has been accused of originating this escape from nature. In view of this Christians need, and liberal humanism needs, a recovery of the naturalness in human life. But theologically there are good reasons for both accepting and rejecting the natural as a theological concept. A recovery in theological method of our natural context is important as a part of the affirmation of human flourishing. The task of natural theology is to deny restrictive and false accounts of naturalness. But natural theology cannot succeed without Christology. A viable concept of the natural always begins from God's self-disclosure in Christ. Natural theology never escapes Christological control. Scott teaches theology at Cheltenham and Gloucester College of Higher Education, UK. (v.10,#1)

Scotti, R, Book Review: *Traveling Light: New Paths for Ecotourism* by Lisa Mastny. *Journal of Environment and Development* 11(no.2, 2002):193-195. (v.13, #3)

Scoville, Judith N., "Cosmos, Creation and Cows: New Perspectives in a Theological Land Ethic," *CTNS (Center for Theology and the Natural Sciences) Bulletin* 18 (no. 2, 1999): 1-9. The interdisciplinary dialogue between science and theology has a critical role in developing a satisfactory doctrine of creation. Also especially helpful is sustainable agriculture's view of farming as cooperation--or conversation--with nature, rather than an attempt to conquer nature. Scoville holds the Hulings Distinguished Chair in Humanities at Northland College, Ashland, WI. (v.10,#1)

Scoville, Judith N., "Fitting Ethics to the Land: H. Richard Niebuhr's Ethic of Responsibility and Ecotheology," *Journal of Religious Ethics* 30(no. 2, 2002):207-229. Much of ecotheology and environmental philosophy has moved deductively from theological and ethical constructs to questions of how we should relate to the natural world. Such approaches are limited in their ability to guide us toward appropriate environmental action for they do not necessarily fit the way the natural world actually functions. Niebuhr's ethic of response, on the other hand, begins with the concrete situation and is

inherently ecological for it focuses on interrelationships in an on-going community. It is inductive in character and open to being informed by new findings in the natural and social sciences; thus it is exceptionally well suited to environmental problems, which involve complex scientific, social, and economic questions. Scoville is in religion and philosophy, Northland College, Ashland, WI.

Scoville, Judith N., "Leopold's Land Ethic and Ecotheology," Ecotheology No 8 (Jan 2000):58-70.

Scoville, Judith N. "Value Theory and Ecology in Environmental Ethics: A Comparison of Rolston and Niebuhr." Environmental Ethics 17(1995):115-133. The objective of Holmes Rolston, III's writings has been the development of an "ecologically formed" environmental ethics based both on environmental values and ecological description. I show how recasting Rolston's value theory in terms of H. Richard Niebuhr's relational value theory can clarify and strengthen this project. Niebuhr developed a theory of value in which value is found in relationships and value systems are constructed in relation to centers of value. Niebuhr's contextual method, with which Rolston's methodology has substantial affinity, is particularly open to the use of such sciences as ecology. I conclude that this recasting of Rolston's important work in terms of relational value and contextual method can clarify the use of ecology in ethics (including the is/ought dichotomy) and can contribute to ethical reflection on such difficult problems as the spotted owl controversy. Scoville is a Ph.D. student at the Graduate Theological Union, Berkeley, and lives in Minneapolis, MN. (EE)

Scrase, J. Ivan, and William R. Sheate, "Re-framing Flood Control in England and Wales," Environmental Values 14(2005): 113-137. Traditionally floods have been understood to be acts of God or nature, with localised impacts afflicting those who choose to live or to invest capital in lowland and coastal locations. This central idea of causation, located outside human agency, survives somewhat precariously today, but is reflected in the lack of any right to protection from flooding in England and Wales. However in 1930 new legislation institutionalised a social framing of the impact of floods as part of a wider national problem. This related the interests of lowland agriculture and land drainage to the national economic and military interest. Modernising and expanding agricultural production was a political priority from the 1930s to the 1980s. The cost of preventing flooding and draining land was transferred from the affected landowners to the nation as a whole. River and coastal engineering was central to the new policy, and by the early 1970s much of the riverine and coastal environment was radically altered by flood defence structures and associated land drainage. As a result of food over-production and conflicts with conservation interests in the early 1980s, the emphasis has shifted from drainage to flood defence, while risk reduction and environmentalist values have also been promoted. The institutional arrangements from 1930 largely survive, however, and a new coherent social framing has failed to emerge. It is argued that for a risk-oriented framing to succeed, new assumptions about causation and a new ethical outlook are now needed. Emphasis on flood 'control' rather than 'defence', and a shift in priorities from economic benefits towards human rights and intrinsic value in nature are proposed as key elements in such a re-framing. Both authors are in environmental science and technology, Imperial College, London. (EV)

Scruton, Roger, "From a View to a Death: Culture, Nature and the Huntsman's Art," Environmental Values 6(1997):471-481. ABSTRACT: The division between the natural and the artificial is itself artificial. But we continue to yearn for a homecoming to our natural state which means, to the identity with our environment which was the condition of the hunter-gatherer. Totemism is the thought-process whereby the prey can be simultaneously consecrated as a species, and pursued to the death as an individual. This thought-process has an evident ecological function. The morality of hunting resides in the maintenance of this dual attitude. An anthropological explanation is offered of the perceived rituals of hunting, and of guiltless killing. Scully, Matthew, Dominion: The Power of Man, the Suffering of Animals, and the Call to Mercy. New York: St. Martins, 2002. We humans may be "of" nature but we are not in it. For better or worse we have dominion over the Earth, and how we manage nature is a moral issue. In our relations to animals we have become insensitive tyrants rather than benign caretakers. It is wrong to be cruel to animals, and when our cruelty expands to the point where we no longer recognize the animals in a factory farm as living creatures capable of feeling pain, or when we insist on an inalienable right to shoot magnificent creatures like elephants for the thrill of it, we debase ourselves. We are called to treat them with kindness, not because they have rights or power or some claim to equality, but in a sense because they don't, because they stand unequal and powerless before us. Until we treat animals with more thoughtfulness, we forfeit the right to call ourselves Homo sapiens. Animals are more than ever a test of our character. Scully is a conservative Republican, one-time speech writer for George W. Bush. Reviewed by Natalie Angier in The New York Times, October 27, 2002. (v.13,#4)

Sea Turtle's Warning, The, New York Times (4/10/98): A18. Unsigned editorial. World Trade Organization rules against law protecting sea turtles. The WTO has ruled that a U.S. law prohibiting shrimp imports from countries that fail to use turtle-excluder devices violates international trade agreements. The law was designed to protect the competitiveness of U.S. shrimpers who must use these devices in their nets to prevent drowning endangered sea turtles. If an appeal fails, the U.S. will have either to open its markets to turtle-destroying shrimpers, to pay a fine, or to suffer retaliatory restrictions on U.S. exports. The ruling could be a prelude to a broader assault on U.S. environmental laws that authorize economic sanctions to protect endangered species and to prevent overfishing. When the U.S.

joined the WTO in 1994, the Clinton Administration assured skeptics that measures to protect the environment were in place. The WTO is required by its charter to consider environmental values, but its central mission to promote free and fair trade appears to win when there is a conflict. (v9,#2)

Seddon, George, Landprints: Reflections on Place and Landscape. Cambridge: Cambridge University Press, 1997. Essays. Examples: "The nature of Nature," "Sense of place," "The genius loci and the Australian landscape," "The rhetoric and ethics of the environmental protest movement," and "The perfectibility of nature (A review of John Passmore, Man's Responsibility for Nature)." His conclusion about "the nature of Nature": "Whether or not there is a world out there independent of our perceptions of it, we cannot escape the variability of those perceptions. The ways in which we perceive, imagine, conceptualise, image, verbalise, relate to, behave towards the natural world are the product of cultural conditioning and individual variation" (p. 13). A further conclusion: "Our ethical and our aesthetic pronouncements are probably the most suspect from our present point of view."

One wonders if this statement is self-referential when he also concludes, about environmental ethics: "The despoliation of land is wrong ... But why is it wrong? Surely because it is an infringement of the rights of later generations, and not because the land has some mystical rights of its own. We must take the custodial view. ... It is my feelings that matter, and if they are mean, it is I or my grandchildren who suffer" (p. 197). Seddon is an Australian academic and environmentalist who has variously worked in English, Philosophy, Geology, History, and Philosophy of Science. (v.10,#3)

Seeley, Thomas D., P. Kirk Visscher and Kevin M. Passino, "Group Decision Making in Honey Bee Swarms," American Scientist 94 (May-June 2006): 220-229. When 10,000 bees go house hunting, how do they cooperatively choose their new nesting site? Most of them cluster in a tree with the queen, while several hundred of them scout for a suitable new hollow tree. Over the course of several days, these scouts search and come back to do waggle dances to promote their finds. Scouts can be recruited from one site to a better one and start dancing for it instead. After some 15 or 20 of the scouts are wagging for the same new site, this is judged "a quorum." The rest of the scouts come around to supporting the same site, so a consensus is achieved before flight. Seeley is in neurobiology and behavior at Cornell University.

Seelye, Katharine, "Bush Proposing to Shift Burden of Toxic Cleanups to Taxpayer," New York Times (2/24/02) and Carol Browner, "Polluters Should Have to Pay," New York Times (3/1/02): editorial page. Giving up on Superfund's polluters pay doctrine. With dwindling resources in the once huge Superfund account, the Bush administration has decided to cut back on the number of sites designated for restoration and shift most of the costs of cleanup from industry to taxpayers. In 1995, Congress ended the corporate taxes that provided the substantial monies necessary to clean up "orphaned" toxic waste sites. In 1994, 20% of the cost of clean up was borne by the taxpayer. President Bush's budget proposal chooses not to try to reauthorize the taxes and proposes that taxpayers pay 50% of the cost in 1993 and 100% in 1994. In an editorial to the New York Times, former Environmental Protection Agency Administrator Carol Browner charges that Bush is abrogating a national promise made in the wake of Love Canal that toxic waste sites would be cleaned up and that "the polluters, not the American people, would pay." (v.13,#1)

Segerdahl, Pär, "Can natural behavior be cultivated? The farm as local human/animal culture," *Journal of Agricultural and Environmental Ethics* 20(2007):167-193. Although the notion of natural behavior occurs in many policy-making and legal documents on animal welfare, no consensus has been reached concerning its definition. This paper argues that one reason why the notion resists unanimously accepted definition is that natural behavior is not properly a biological concept, although it aspires to be one, but rather a philosophical tendency to perceive animal behavior in accordance with certain dichotomies between nature and culture, animal and human, original orders and invented artifacts. The paper scrutinizes the philosophy of natural behavior as it developed in the organic movement in response to a perceived contrast between industrialized and traditional agriculture. There are two reasons for focusing on the organic movement: (i) the emphasis on "the natural" is most accentuated there and has a long history, (ii) everyday life on organic farms presupposes human/animal interplay, which conflicts with the philosophical tendency to separate nature from culture. This mismatch between theory and practice helps us see why, and how, the philosophy of natural behavior needs to be reconsidered. The paper proposes that we understand farms as local human/animal cultures, and asks what we can mean by natural behavior in such contexts. Since domestic animals adapt to agricultural environments via interaction with caretakers, such interplay is analyzed as "hub" in these animals' natural behavior.

Keywords: animal caretaker - animal husbandry - animal welfare - domestication - double imprinting - human/animal culture - mutual adaptation - natural behavior - organic movement

Seligman, Clive, "Environmental Ethics," Journal of Social Issues 45 (no. 1, 1989):169-184. The central question is on what ethical basis should we decide how to deal with nature. Is a human centered, utilitarian perspective sufficient to protect the environment? If not, what alternatives are possible? A key philosophical problem is to what extent inherent value can be ascribed to things that are not human: animals, vegetation, and even land. Philosophers do not agree among themselves on these issues. An environmental ethic should explicitly consider whether our behavior toward nature is consistent with our values, that is, consistent with our "best selves." A psychological theory of how humans value may provide some insights into the way we think about ethical dilemmas. As our personal values deepen, we will be increasingly inclined to do the right thing environmentally. Seligman is in psychology at the University of Western Ontario. (v5,#4)

Serafin, Rafal. "Noosphere, Gaia, and the Science of the Biosphere." Environmental Ethics 10(1988):121-37. Advances in analytical understanding of the biosphere's biogeochemical cycles have spawned concepts of Gaia and noosphere. Earlier in this century, in concert with the Jesuit paleontologist Pierre Teilhard de Chardin, the natural scientist Vladimir Vernadsky developed the notion of noosphere--an evolving collective human consciousness on Earth exerting an ever increasing influence on biogeochemical processes. More recently, the chemist James Lovelock postulated the Earth to be a self-regulating system made up of biota and their environment with the capacity to maintain a planetary steady state favorable to life. This is the Gaia hypothesis. To many, Gaia and noosphere represent contradictory interpretations of humanity's relation to planetary ecology. Noosphere emphasizes a free will and obligation to shape the destiny of humanity on Earth through technology and new kinds of social relations. In contrast, Gaia invokes mysterious mechanisms of planetary evolution that lie beyond human control and understanding. I argue that if brought together, noosphere and Gaia can provide a useful symbol for guiding human interventions in global ecology because the contradictions of a nature-centered view of Gaia and a human-centered view of noosphere are coming to be irrelevant with the emergence of an analytical science of the biosphere. Serafin is at the School of Urban and Regional Planning, University of Waterloo, Ontario, Canada. (EE)

Serres, Michel, The Natural Contract. Ann Arbor: University of Michigan Press, 1995. Originally published as: Le Contrat Naturel. Paris: Editions Françoia Bourin, 1992. Serres wants to insert ethics into the human relation to nature, and vice versa. Hitherto, human relations with other humans have been in the discourse of ethics and politics; human relations with nature in the discourse of science and technology. In an environmental crisis, humans are now racing toward a violent demise, on a course set by Cartesian philosophy, one that is "blind to nature," where nature has been "forgotten" and "lost." "At stake is the Earth in its totality, and humanity, collectively. Global history enters nature; global nature enters humanity; this is something utterly new in philosophy" (p. 4). This is "a time when the old social contract ought to be joined by a natural contract" (p. 20). "Back to nature, then! This means we must add to the exclusively social contract a natural contract of symbiosis and reciprocity in which our relationship to things would set aside mastery and possession in favor of admiring attention, reciprocity, contemplation, and respect; where knowledge would no longer imply property, nor action mastery" (p. 38). We need a natural contract, as much as a social contract. Mountain climbers are harnessed not only to each other but to the rock face. "The group finds itself bound and submitted not only to itself but to the objective world." That is a metaphor for humans bound both to each other and to the natural world. "A natural contract joins the social contract" (p. 104). We need a hermeneutic interlocking of nature and culture. If there is no attention to the natural contract, we will be like the two men in a painting by Goya who are locked in combat with each other, while neglecting the mud into which they are sinking and which can defeat them both (pp 1-2). Modern philosophy has supposed that humans form a social contract and leave the state of nature, as if the human race "casting off from the world, were no longer rooted in anything but its own history" (p. 34). Such philosophy is so humanistic that it becomes locked and lost within a realm of human consciousness and society, free-floating outside the realm of nature. It has the "weakness of thinking `only men,' or men alone. We have not yet set up a scale in which the world is taken into account in the final balance sheet" (p. 37). This will require the natural contract joined with the social contract. "In fact, the Earth speaks to us in terms of forces, bonds, and interactions, and that's enough to make a contract. Each of the partners in symbiosis thus owes, by rights, life to the other, on pain of death" (p. 39). Serres is especially impressed with the globalization of the environmental threat. "Now we must learn and and teach around us the love of the world, of our Earth, which we can henceforth contemplate as a whole" (p. 49). "Today the global power of our new tools is giving us the Earth as a partner, one whom we ceaselessly inform with our movements and energies, and who, in turn, informs us of its global change by the same means. ... We've been living contractually with the Earth for only a little while. A new revolution, in the Copernican sense, for our grandeur and our responsibilities. ... Curiously, it is only in this century that nature has been born, really, before our eyes, at the same time as a humanity bound in real solidarity" (pp. 109-111). "Cast off far enough from Earth, we can finally look at her whole. ... Here is a hazy ball surrounded by turbulence. Planet Earth as satellites photograph her. Whole. ... For the first time, philosophy can say man is transcendent: before his eyes, the whole world is objectifying itself, thrown before him, object, bond, gear, or craft ... the most beautiful sphere" (pp. 120-121). Often cryptic and difficult to read, but frequently insightful and always passionate. This book puts an end to the lament that there is no French environmental philosophy. Serres teaches philosophy at the Sorbonne, and at Stanford University. (v6,#4)

charged with protecting endangered species are caught in a battle over water rights; a critical National Academy of Sciences report has exposed them to heavy fire. The Klamath River basin is in southern Oregon and northern California. Issues about how much water is enough for endangered salmon. Also issues about which side to err on when the science is uncertain.

Service, Robert F., "Microbiologists Explore Life's Rich, Hidden Kingdoms," Science 275(21 March, 1997):1740-1742. Microbial biodiversity. Recent studies, using DNA analysis, have found that there is staggering diversity among the microbes, who seem to outdo the insects considerably in their numbers of species. Also microbes may be more endemic to particular areas and microhabitats than previously thought, and more disrupted by pollution and oilspills. (v8,#1)

Service, Robert F. "A Growing Threat Down on the Farm." *Science* Vol. 316, no. 5828 (25 May 2007): 1114-17. Farmers have become dependent on an herbicide called glyphosate (tradename "Roundup") and on crops engineered to resist itso-called "Roundup Ready crops." The herbicide kills all the weeds but the resistant crops grow unaffected by it. Over 50% of all soybeans and about 40% of all corn in the U.S. are modified as Roundup Ready crops. But their weeds are rapidly becoming resistant, and researchers are scrambling for new alternatives. Glyphosate is claimed to be environmentally friendly; it doesn't readily leach into water systems. Instead it latches tightly to soil particles and degrades within weeks into harmless byproducts. Also farmers who use it plow less, with less soil erosion.

125. As the title indicates, this is a "history" of the literature of the Deep Ecology movement. It is valuable mainly for the extensive notes which list hundreds of primary sources. (Katz, Bibl # 1)

Sessions, George and Bill Devall. "The Development of Natural Resources and the Integrity of Nature." Environmental Ethics 6(1984):293-322. During the twentieth century, John Muir's ideas of "righteous management" were eclipsed by Gifford Pinchot's anthropocentric scientific management ideas concerning the conservation and development of Nature as a human resource. Ecology as a subversive science, however, has now undercut the foundations of this resource conservation and development ideology. Using the philosophical principles of deep ecology, we explore a contemporary version of Muir's "righteous management" by developing the ideas of holistic management and ecosystem rehabilitation. Sessions is in the philosophy department, Sierra College, Rocklin, CA. Devall is in the sociology department, Humboldt University, Arcata, CA. (EE)

Sessions, George, "Deep Ecology in California." To appear in a special California issue of Dialectics and Humanism (Polish International Philosophical Journal), 1990-91. Sessions traces the distinctive development of deep ecology in California, acknowledging important roots outside California (Leopold, the Transcendentalists, Muir in Wisconsin, Naess in Norway, others in Australia). "It would be safe to say that the rebirth of radical ecology in the 1960's was largely a California phenomenon." He closes with California at crisis point. "The ultimate fate of California, in all likelihood, will be decided in the coming decade or two." Copies from George Sessions, Department of Philosophy, Sierra College, Rocklin, CA 95677-3397. (v1,#3)

Sessions, George, "Reply to Rothenberg's and Crowley's Replies to Quick's, Drengson's, Sessions's, and Devall's Replies to Crowley's Report on a Visit with Arne Naess," *Newsletter, International Society for Environmental Ethics*, vol 19, no. 2, Spring/Summer 2008, pp.39-50. "Arne Naess' Complex Legacy," a report on a visit with Arne Naess by Yale undergraduate student Thomas Crowley, was published in the Fall 2006 ISEE Newsletter. In the Winter 2006-2007 ISEE Newsletter, Tim Quick, Alan Drengson, George Sessions, and Bill Devall replied to Crowley's report. In the Fall 2007 ISEE Newsletter, David Rothenberg and Thomas Crowley replied to Quick's, Drengson's, Sessions's, and Devall's replies. The dialogue continues here with a further reply by George Sessions, Sierra College in Rocklin, California. Online at: <http://www.cep.unt.edu/ISEE/index.htm>.

Sessions, George. "Postmodernism, Environmental Justice, and the Demise of the Deep Ecology Movement?" Wild Duck Review: Literature and Letters of Northern California, vol. 1, no. 5, June/July 1995, pages 14-16. Sessions reviews some current trends, with particular attention to Michael Zimmerman, Contesting Earth's Future. Zimmerman, now rejecting the Heidegger he earlier followed, has gone too far in holding that all positions are power-positions "contesting Earth's future," each promoting its own interests; he cannot consistently say this and hold that nature in itself has intrinsic value or that the integrity of ecosystems should be preserved. The power position account erodes the intrinsic value account. Deep ecology is not one more power position, among others. Sessions teaches philosophy at Sierra College, Rocklin, CA. For copies, contact: Wild Duck Review, 419 Spring Street, Suite D, Nevada City, CA 95959 USA. (v6,#3)

Sessions, George. "Wildness, Cyborgs, and Our Ecological Future: Reassessing the Deep Ecology Movement," The Trumpeter 22,2, (2006): 121-182 (online) <http://trumpeter.athabascau.ca/>.

In light of the new environmental awakening over global warming and Al Gore's new video, in contrast with the world's scientists and religious leaders, Sessions asks where the new generation of post modernist environmental historians and ecophilosophers (the Neo-Pragmatists) are in this new awakening? In reassessing the deep ecology movement, he critiques John Clark's version of social ecology, the ecofeminism of Val Plumwood and Karen Warren, Baird Callicott's interpretation of Leopold, the deconstruction of wilderness from Guha to Cronon, and Michael Zimmerman's endorsement of Donna Haraway's postmodernist cyborgian technotopian future. He claims that the attempt to establish a cyborgian / nanotechnology / technotopia, as opposed to the protection of a wild Earth, will result in the final sealing of the fate of both humanity and the Earth. Sessions is philosophy emeritus, Sierra College, Rocklin, CA.

Sessions, George. "Political Correctness, Ecological Realities and the Future of the Ecology Movement." Wild Duck Review: Literature and Letters of Northern California, vol. 1, no. 6, September 1995, pp. 10-13. Sessions continues his review of current trends, with particular attention to Gregg Easterbrook, A Moment on the Earth. In his positive account of the environment, Easterbrook selects certain environmental indices that, while perhaps true, ignore other indices that are ecologically more significant. Seyfang, Gill, "Cultivating Carrots and Community: Local Organic Food and Sustainable Consumption," Environmental Values 16(2007): 105-123. This paper examines the social implications of sustainable consumption through an empirical study of a local organic food initiative. It sets out an analytical framework based upon Douglas's Cultural Theory to categorise the range of competing value perspectives on sustainable consumption into 'hierarchical', 'individualistic' and 'egalitarian' worldviews, and considers how these various worldviews might each adopt locally-grown organic food as a sustainable consumption initiative. Tensions between the paradigms are evident when attention is turned to a case study of a local organic food producers' cooperative. Research with both producers and consumers reveals that the values embedded in its practice are both partisan and pluralistic, but are principally 'Egalitarian'. Its interactions with policy regimes and social and economic institutions are examined, to illustrate the value conflicts inherent, and understand the barriers it faces in operation and the institutional factors inhibiting the growth of grassroots 'bottom-up' sustainable food initiatives of this kind. In addition to addressing these barriers, the policy implications of these findings for sustainable consumption policy and practice are discussed. Seyfang is at the centre for Social and Economic Research on the Global Environment, University of East Anglia, Norwich, UK.

Shafer, Craig L., "The Northern Yellowstone Elk Debate: Policy, Hypothesis, and Implications," Natural Areas Journal 20(no. 4, 2000):342-359. Intervention versus non-intervention in management of the northern Yellowstone National Park elk herd. Historical facts reviewed and the value judgments with which such facts were discovered and interpreted. National park size influences the need for management intervention because of alteration of natural processes outside park boundaries. Is the need for intervention increasing as large spatial scale natural processes are progressively impeded outside the park? A mixture of intervention and nonintervention may be the best approach to keep the park most "natural." Shafer is with the George Wright Society, Hancock, MI. (v.13,#1)

Shafer, Craig L., "A Geography of Hope: Pursuing the Voluntary Preservation of America's National Heritage," Landscape and Urban Planning 66(no. 3, 2004):127-171. A review of the National Natural Landmarks program, administered by the National Park Service, and designed to encourage the voluntary preservation of nationally significant examples of various ecological and geological features. There are today 587 such areas on lands of every ownership category. But the program has suffered from being perceived as a threat to private landowner rights. To provide for significant increase in the program's effectiveness, private landowners should be offered substantial economic incentives for protecting their property's natural values. Shafer is with the George Wright Society, Hancock, MI.

Shafer, Elwood L. and James B. Davis, "Making Decisions about Environmental Management When Conventional Economic Analysis Cannot Be Used," Environmental Management, vol. 13, no. 2 (1989):189-197. A process is described for making comparative valuations of a wide range of environmental management activities when the combined social, economic, managerial, and political benefits of some (but not all) of these activities cannot be adequately described in economic terms and when budgetary constraints do not permit funding of all activities under consideration. The process accounts for subjective judgment and contains a formal rigorous decision strategy that takes the place of intuition when quantitative and qualitative values of environmental activities need to be evaluated. Shafer is in the Department of Recreation and Parks, Pennsylvania State University. Davis is at the Pacific Southwest Forest and Range Experiment Station, Riverside, CA. (v2,#2)

Shand, Hope, "Terminator Seeds: Monsanto Moves to Tighten Its Grip on Global Agriculture," Multinational Monitor, November 1998, pp. 13-16. Seeds that work once and produce plants that produce only sterile seeds, forcing farmers worldwide to return to Monsanto to purchase new seeds each season. Critics call them terminator seeds; Monsanto says it is a "technology protection system." Such seeds are some time off but under development. Monsanto, now the world's largest seed company, says farmers will not buy such seeds unless it is to their advantage; they will just continue to use the old ones. Farmers have been saving seeds for next year for 12,000 years, selecting for better crops. Various hybrids have been in use for many decades that are sterile, although the hybrids have increased vigor and crop yield. Critics say the farmers will get hooked on the terminator seeds. Others worry about environmental spillover. Monsanto now advertises Monsanto's Law: The ability to identify and use genetic information is doubling every 12 to 24 months--analogously to Moore's law (predicted in 1965) that the computing power of computer chips would double every 18-24 months. (v.10,#1)

Shand, Hope, "There is a Conflict Between Intellectual Property Rights and the Rights of Farmers in Developing Countries", Journal of Agricultural and Environmental Ethics 4(1991):131-142. In a debate: Is there a conflict between intellectual property rights and the rights of farmers in developing countries?

Shaner David Edward, and R. Shannon Duval, "Conservation Ethics and the Japanese Intellectual Tradition," Environmental Ethics 11(1989):197-214. Well-documented article discussing the connections between American philosophy, Japanese philosophy, and a holistic environmental ethic. The crucial concept is the cultivation of a sensitivity to nature; this idea is traced through the Zen philosophy of Nishida Kitaro, the radical empiricism of William James, and the natural science methodology of Louis Agassiz. (Katz, Bibl # 2)

Shaner, David Edward, and R. Shannon Duval. "Conservation Ethics and the Japanese Intellectual Tradition." Environmental Ethics 11(1989):197-214. A systematic philosophy that presupposes an ecocentric world view, rather than a homocentric or egocentric world view, can be a viable resource for investigating issues in environmental philosophy and conservation ethics. Generally speaking, the Japanese philosophical and religious tradition represents a commitment to ecocentrism. This philosophical orientation is in concert with the world view of many naturalists. We explore one example of ecocentrism by unveiling the crosscultural connection between the naturalistic philosophy of Louis Agassiz, a nineteenth-century French-American biologist, and the early writings of Nishida Kitaro, a twentiethcentury Japanese philosopher. We suggest that the central player in understanding the ecocentric connection between Agassiz and Nishida is American philosopher/psychologist William James. James was once a student of Agassiz and his writings influenced Nishida's early work. Related issues concerning conservation ethics and the Japanese intellectual tradition are also addressed. Shaner is in the philosophy department, Furman University, Greenville, SC. Duval is a Dana Foundation Research and Teaching Assistant at Furman University, Greenville, SC. (EE)

Shannon, Daniel E., "A Criticism of a False Idealism and Onward to Hegel: Objections to the Gaia Hypothesis," The Owl of Minerva 27(no. 1, Fall 1995):19-36. An argument against the Gaia hypothesis as formulated by James Lovelock, who offers a scientific explanation for it, and by Peter Russell, who offers an idealistic system in order to accommodate the theory (in The Awakening Earth: The Global Brain, Routledge, 1982). An argument for an alternative account, one which Hegel presented in his Philosophy of Nature, which Shannon calls the "ecological hypothesis." If the Gaia hypothesis is taken as the claim that the Earth is somehow alive, the answer is decidedly no. But a more modest proposal is still possible that views the Earth as a complexity of processes that engender life. Hegel supports a theory that offers such a proposal. These are fundamental claims about the planet, but in Hegel's system, they involved an essential insight into nature as a whole, showing how the Earth yields life, though it is not itself alive. Shannon is at Depauw University. (v7,#1)

Shapiro, J. A. (James A.), "A 21st Century View of Evolution," Journal of Biological Physics 28(2002):745-764. In contrast to the Darwinian view of evolution as a random walk, undirected mutations and contingent evolution, Shapiro and other complex systems theorists are now interpreting these processes as a form of natural genetic engineering. Genomes are hierarchically organized as systems assembled from DNA modules. There are various routines for re-arranging these genetic modules and using other mobile genetic elements, often in times of stress, that are better seen as natural genetic engineering than as a random walk. Many of the enzymes that geneticists now use to cut and splice and re-arrange genes were already doing this for millennia in the natural history of the genome. A similar article is James A. Shapiro: "A 21st Century View of Evolution: Genome System Architecture, Repetitive DNA, and Natural Genetic Engineering," Gene 345(2005):91-100. "These developments ... suggest some new ways of thinking about genomes as sophisticated informatic storage systems and about evolution as a systems engineering process" (Abstract, p. 91). Shapiro is in biochemistry and molecular biology, University of Chicago.

Shaw, Bill. "A Virtue Ethics Approach to Aldo Leopold's Land Ethic." Reprinted in Ronald Sandler and Philip Cafaro (eds.), Environmental Virtue Ethics (Lanham, MD: Rowman and Littlefield, 2005).

Shaw, Bill. "A Virtue Ethics Approach to Aldo Leopold's Land Ethic." Environmental Ethics 19(1997):53-67. I examine "The Land Ethic" by Aldo Leopold from a virtue ethics perspective. Following Leopold, I posit the "good" as the "integrity, stability, and beauty" of biotic communities and then develop "land virtues" that foster this good. I recommend and defend three land virtues: respect (or ecological sensitivity), prudence, and practical judgment. Shaw is in the Department of Management Science and Information Systems, University of Texas, Austin. (EE)

Shaw, Derek, Owning the Natural World, 1996, University of Colorado, Boulder, Ph.D. thesis in philosophy. 263 pages. Philosophical reflections on property explain how our property institutions enable us to achieve valued goals, such as maximizing satisfied preferences. Many philosophers assume that the normative conclusions of property theory are universally valid. This is mistaken. Liberal philosophical justifications of private property are based on values and intuitions that are created within the context of private property-based societies. Our relations to the natural world, which are often assumed to be only mediated by property, are in fact determined and limited by the "nature" of our property regime. The ownership conventions (and land rights) of many native peoples have been overlooked and/or destroyed. Property theory can never be used to justify the imposition of Western-style ownership conventions onto native societies. Broader perspectives on property result from investigating the phenomenology and genealogy of property. The advisor was James Nickel. (v.10,#1)

Shaw, R. Paul, "Warfare, National Sovereignty, and the Environment," Environmental Conservation 20 (no. 2, Summer 1993):113-121. A sobering article. Armed conflict does enormous damage to the environment, which may take decades and centuries to recover, if recovery is possible at all. Combined shooting and silent wars cripple the capacity of governments to raise funds for environmental investments and undercut prospects for sustainable development, especially in Third World countries. The enduring relationship between war proneness and nation-building shackles efforts by the international community to protect the global commons. Unfortunately, this runs deep in human nature. The evolutionary process produced, in the interests of ethnic self-defense, a human disposition to nationalism that is largely incompatible with protecting the global commons. For ninety-nine percent of our heritage, protecting the global environment was not a perceived problem. There is some hope, however, in the concept of a homeland, as distinct from that of a nation state, toward which humans do have an innate disposition to care. Perhaps we can come to see Earth as a homeland, or, more realistically, to see how global trends may affect our homelands adversely. This could help to enable diverse peoples to act in concert globally and to protect their environments regionally. Shaw is an economist with the World Bank. (v5,#4)

Shea, Nancy Huffman, The Status of Ecophilosophy and the Ideology of Nature. Ph.D. thesis, University of Massachusetts, 1991. Ecophilosophy is an attempt to render a new philosophy of nature, generated by the need to liberate nature from the inherently domineering disposition of humankind. Although I am sympathetic to this effort, I believe that the current ambiguity of its content (who or what is to survive) carries with it the potentiality for new forms of oppression. I argue that ecophilosophy suffers from a kind of Habermasian self-deception, taking on a vague concept of nature that deceptively appears to do the philosophical work of healing the epistemological gap between nature and humans. My reconstruction unifies this loosely-defined vision along the lines of an equivocal use of two key concepts, the domination of nature and nature itself, revealing the potentially subversive character of its implicitly universalist philosophy of nature.

Ecophilosophers, rather than distinguishing themselves, fail to improve upon Francis Bacon's suggestion that attention to nature will liberate us. Their satisfaction with ecological solutions indicates that they miss the essential ideological consequence of the modern project: the domination by some

humans over others has been covered over by a self-deceptive belief in the liberating character of scientific methodology. By arguing for the emancipatory capacity of ecology, they get themselves into a Marcusean-like bind, advocating this new science while at the same time rejecting scientific rationality as a pivotal component of their notion of the domination of nature. Because of this they are forced to argue that ecology is qualitatively different, offering a new kind of rationality that contains the necessary ingredients for radically changing society.

Ecophilosophers must reconsider the epistemologically naive and ideologically negative repercussions of this position as I demonstrate with an analysis of the potentially repressive relationships that exist between fourth world cultures and the environmental community. I conclude by subjecting the Habermasian universalist framework to revision as indicated by the possibilities of a new eco-vision, emerging from the contextual episteme of a reworked ecofeminist perspective. The advisor was Robert Paul Wolff. Shea is now director of the Murie Center in Grand Teton National Park. (v10,#4)

Shea, William R. and Beat Sitter, eds., Scientists and their Responsibility. Canton, MA: Watson Publishing International, 1989. Hardbound. 348 pages. The first section is "Human Responsibility and the Natural Order," and includes (among others) the following papers:

Jürgen Mittelstrass, "Ethics of Nature" (mostly our responsibilities toward nature as a whole with reference to the dependence of future generations on an intact nature); Kristin Shrader-Frechette, "Ecological Theories and Ethical Imperatives: Can Ecology Provide a Scientific Justification for the Ethics of Environmental Protection?" (anticipating the argument of Shrader-Frechette and McCoy, Method in Ecology); Beat Sitter, "In Defence of Nonanthropocentrism in Environmental Ethics" (seven ways of using "anthropocentrism," five aspects of "nature"; four principles for environmental ethics; there is an obligation to respect all beings, with a reply to Shrader-Frechette). Shea is professor of history and philosophy of science at McGill University, Montreal. Beat Sitter (now Sitter-Liver) is Secretary General of the Swiss Academy of the Humanities and the Swiss Academy of Sciences. (v4,#4)

Shea, William R. and Beat Sitter, eds., Scientists and Their Responsibility. Canton, MA: Watson, 1989. This collection has several chapters dealing with environmental ethics. Kristin Shrader-Frechette, "Ecological Theories and Ethical Imperatives," pp. 73-104, argues that the science of ecology will not provide the necessary support for either a holistic environmental ethic nor a "balance of nature" environmental ethic. Beat Sitter, "In Defense of Nonanthropocentrism in Environmental Ethics," pp. 105-145, answers Shrader-Frechette in a wide-ranging defense of nonanthropocentrism, including the claim that the weakness of ecological science insures its ethical relevance (p. 126). Also chapters by Robert K. Colwell, "Natural and Unnatural History: Biological Diversity and Genetic Engineering," pp. 1-40, and Jürgen Mittelstrass, "Ethics of Nature," pp. 41-57. (Katz, Bibl # 2)

Sheard, Murray. "Sustainability and Property Rights in Environmental Resources." *Environmental Ethics* 29(2007):389-01. How do we weigh the claims of current and future people when current exercise of rights to property conflict with sustainability? Are property rights over these resources more limited due to the claims of posterity? Lockean property rights allow no right to degrade resources when doing so threatens the basic needs of future generations. A stewardship conception of property rights can be developed, providing a justification for sustainable management legislation even when such law conflicts with the rights an owner would have, were the resource under more full-blown ownership. A protection indicator can be developed that is sensitive to a range of empirical factors such as scarcity, renewability, importance of the resource, and seriousness and reversibility of potential harm. The stewardship conception of rights over environmental resources can be applied in policy settings, for example, in decisions over emissions limits and land-use patterns. Such harnessing of Lockean intuitions to argue for environmental protection is in sharp contrast to Locke's usual employment by those keen to show that such protection violates owners' rights. (EE)

Shearman, Richard, "Can We Be 'Friends of the Earth'?" Environmental Values 14(2005): 503-512. Reasons for protecting biodiversity are usually defined in terms of its instrumentality. Although there may be a number of ways to seek an alternative non-anthropocentric approach, I have chosen to develop an Aristotelian response that draws upon his conception of friendship and self-love. In doing so, I argue that a person living according to moral virtue will recognise that the nonhuman world should be valued and thus protected (at least in part) for its own sake. Shearman is in science, technology, and society, Rochester Institute of Technology, Rochester, NY. (EV)

Shearman, Richard, "The Meaning and Ethics of Sustainability," Environmental Management 14(1990):1-8. Some have argued that the meaning of sustainability varies according to context. Shearman disputes this. It is not the meaning of sustainability that changes but our understanding of the context itself. Contradictions arise when conceiving each context in terms of sustainability. We should be concerned not with the meaning of sustainability but with the implications of sustainability as they affect the status quo. We must be prepared to answer the question: Why is sustainability desirable. This approach is applied to ecologically sustainable development. Shearman is in the program in Environmental Science, State University of New York, Syracuse. (v2,#1)

An account of how the herbal and pharmaceutical industries have discovered and used medicinal plants the impact of this on forest communities. (v7,#4)

Sheldon, Joseph K., Rediscovery of Creation: A Bibliographical Study of the Church's Response to the Environmental Crisis. Metuchen, N. J., American Theological Library Association and Scarecrow Press, 1992. 300 pages. \$ 35.00. There are 1,700 references, dealing with religion and the environment, also ecofeminism, ecojustice, economics, wilderness, biotechnology. There is a long introductory essay, beginning with the 1967 attack by Lynn White and following the churches in their response. There are a number of typographical errors. (v3,#3)

Sheldrake, Rupert, The Rebirth of Nature: The Greening of Science and God (New York: Bantam Books, 1991). \$ 21.95. 260 pages. An iconoclastic scientist takes a look at the regenerative power of nature and offers his own controversial theory of a living Earth, Gaia, that is far from its end. Sheldrake also takes a religious turn. After several years in India, Sheldrake reports, "Much to my surprise, I found myself being drawn back to Christianity." Nor does he mind including many New Age ideas. Sheldrake is a maverick biochemist and cell biologist at Cambridge University and sometime philosophy student at Harvard University. (v2,#1)

Sheldrake, Rupert, The Rebirth of Nature: The Greening of Science and God. London: Rider, 1990, 1991. An imprint of Random Century Group, Ltd, 20 Vauxhall Bridge Road, London SW1V 2SA, and available in several other nations. Our earlier ancestors took it for granted that the world was "alive," but the official view of nature as a mechanistic, inanimate storehouse of riches and resources to be exploited for human gain has dominated for the past several hundred years and brought with it unprecedented abuse of the living world. Now there are new developments in science that make such a viewpoint no longer valid. We are on the threshold of a new understanding of nature in which traditional religious wisdom, personal experience, and scientific insight can be mutually enriching, and produce a society in which humans are in harmony with living nature. (v3,#3)

Shellenberger, Michael and Ted Nordhaus, "The Death of Environmentalism: Global Warming Politics in a Post-Environmental World." Breakthrough Institute, 2005. Online: <http://thebreakthrough.org/images/Death%5Fof%5FEnvironmentalism.pdf>. Claims vociferously that old-time environmentalism--a la Sierra Club, Wilderness Society, Audubon Society--is dead, because it became a special interest group, with narrow focus. Meanwhile issues have become global, comprehensive, with activities in government, society, commerce thoroughly merged with concerns about nature, best illustrated in global warming. Much of the booklet is based on interviews with 25 of the environmental communities' top leaders. "Modern environmentalism is no longer capable of dealing with the world's most serious ecological crisis." "Not one of America's environmental leaders is articulating a vision of the future commensurate with the magnitude of the crisis." (from the Introduction). Shellenberger is with the Breakthrough Institute. Nordhaus is with Evans McDonough Company.

Shiva, Vandana, "Stolen Harvest: The Hijacking of the Global Food Supply," Philosophy and Geography 4 (No. 1, 2001): 127-129. Book reviewed by Maskit, Jonathan. (P&G)

Shiva, Vandana, Stolen Harvest: The Hijacking of the Global Food Supply. Cambridge, MA: South End Press, 2000. The values of traditional agriculture are being undermined by the corporate interests behind the latest revolutions in agricultural technology. The interests of corporations are now starkly in contrast with the interests of the people who need to eat and of the farmers, especially the women farmers. "The notion of rights has been turned on its head. ... The right to produce for oneself or consume according to cultural priorities and safety concerns has been rendered illegal according to the new trade rules. The rights of corporations to force-feed citizens of the world with culturally inappropriate and hazardous foods has been made absolute. The right to food, the right to safety, the right to culture are all being treated as trade barriers that need to be dismantled" (p. 18) The Indian cow--integrated into the life of the people spiritually, physically, and emotionally--is better than the "mad cow," a cow fed on animal carcasses, an artifact of animal agriculture (p. 75). (v.13,#1)

Shiva, Vandana, The Violence of the Green Revolution: Third World Agriculture, Ecology, and Politics. Cloth and paper. 264 pages. London: Zed Books; Penang, Malaysia, Third World Network, 1991. An examination of the Green Revolution on the breadbasket of India. The quick fix promise of large gains in output pushed aside serious pursuit of an alternative agricultural strategy grounded in respect for the environmental wisdom of peasant systems and building an egalitarian, needs-oriented agriculture, consistent with the village-based, endogenous political traditions of Gandhism. There was destruction of genetic diversity and soil fertility, and the Green Revolution contributed to the acute social and political conflicts now tearing the Punjab apart. Shiva argues in critique of the privileged epistemological position alleged by modern science which allows it both to claim to provide technological solutions for social and political problems while at the same time disclaiming responsibility for the new problems that it creates in its wake. Further, there has been a continuing ripoff as the industrialists and geneticists of the First World have stolen Third World genetic resources. "The US ... has freely taken the biological diversity of the Third World to spin millions of dollars of profits, none of which have been shared with Third World Countries, the original owners of the germplasm" (p. 260). Shiva is a philosopher and feminist, and director of the Research Foundation for Science, Technology and Natural Resource Policy, Dehradun, India. (v3,#3)

Shiva, Vandana, "The Seed and the Earth: Women, Ecology, and Biotechnology," The Ecologist 22(no. 1, January/February 1992):4-7. Western society gives a high value to scientific creation and a correspondingly low value to natural procreation. It thus legitimates the encroachment of technological development into both the female body and the seed. Shiva is director of the Research Foundation for Science, Technology and Natural Resource Policy, Dehra Dun, India. (v5,#2)

Shiva, Vandana. *Soil Not Oil: Environmental Justice in an Age of Climate Crisis*. Cambridge, MA: South End Press, 2008. Shiva condemns industrial agriculture because of its dependence on fossil fuels and globalization and its contribution to climate change. She uses the Himalayan organization Navdanya as a model for championing the small, independent farm that is biologically more diverse, puts more resources into the hands of the poor, and replaces corporate power and profits with community, self-organization, and community. Shiva argues that the solution to poverty is the solution to climate change.

Shivik, John A., "Tools for the Edge: What's New for Conserving Carnivores," BioScience 56 (no.3, March 2006): 253-259 (7). The loss of large carnivores at the edges of parks, preserves, and human habitations threatens the conservation of many species. Thus, effective predation management is a conservation issue, and tools to mitigate conflicts between humans and predators are required. Both disruptive-stimulus (e.g., fladry, Electronic Guards, radio-activated guards) and aversive-stimulus (e.g., electronic training collars, less-than-lethal ammunition) approaches are useful, and technological advances have led to many new, commercially available methods. Evaluating the biological and economic efficiency of these methods is important. However, social and psychological effects should also be considered.

Shrader-Frechette, Kristin. "Environmental Impact Assessment and the Fallacy of Unfinished Business." Environmental Ethics 4(1982):37-47. Nearly all current attempts at environmental impact analysis and technology assessment fall victim to an ethical and methodological assumption that Keniston termed "the fallacy of unfinished business." Related to one version of the naturalistic fallacy, this assumption is that technological and environmental problems have only technical, but not social, ethical, or political solutions. After using several impact analyses to illustrate the policy consequences of the fallacy of unfinished business, I suggest how it might be overcome. Next I present three standard arguments, repeatedly used in technology and environmental impact assessments, by those who subscribe to this "fallacy." I briefly examine the logical, consequentialist, and historical reasons for rejecting all three arguments in favor of this assumption. If my suggestions are correct, then environmental impact analysis is not only a matter of discovering how to finish our technological business, but also a question of

learning how to recognize the ethical and epistemological dimensions of our assessment tasks. Shrader-Frechette is in the philosophy department, University of Louisville, Louisville, KY. (EE)

Shrader-Frechette, Kristin, "Parfit, Risk Assessment, and Imperceptible Effects." Public Affairs Quarterly 2:4 (October 1988): 75-96. Second in a continuing dialogue between Shrader-Frechette and Derek Parfit on problems with the assessment of moral actions over long periods of time. The first paper was "Parfit and Mistakes in Moral Mathematics," Ethics 97 (1987): 50-60. Three of Parfit's arguments for not ignoring imperceptible effects are challenged, although Shrader-Frechette agrees with the conclusion. She suggests instead a framework of probabilistic risk assessment. (Katz, Bibl # 2)

Shrader-Frechette, Kristin and McCoy, Earl D. "Molecular Systematics, Ethics, and Biological Decision Making under Uncertainty." Conservation Biology : The Journal of the Society of Conservation Biology 13(No. 5, Oct. 1999):1008- . (v10,#4)

Shrader-Frechette, Kristin S., and Earl D. McCoy, "Ecology and Environmental Problem-Solving," The Environmental Professional 16(1994):342-347. Contemporary community ecology has neither precise foundational concepts dealing with stability or community structure nor a developed general theory yielding precise predictive power. As a consequence, it has no exceptionless empirical laws useful to environmental problem-solving. Despite these deficiencies, ecology can provide a foundation for environmental policy by means of autecology, natural history, and detailed case studies. By focusing on less theoretical and more practical scientific work, ecologists have been able to guide conservation decisions in cases such as controlling the vampire bat and protecting the red-cockaded woodpecker. Shrader-Frechette is in philosophy and McCoy in biology at the University of South Florida. (v5,#4)

Shrader-Frechette, K. S. and McCoy, Earl D., "How the Tail Wags the Dog: How Value Judgments Determine Ecological Science." Environmental Values 3 (1994):107-120. Philosophers, policymakers and scientists have long asserted that ecological science - and especially notions of homeostasis, balance, or stability - help to determine environmental values and to supply imperatives for environmental ethics and policy. We argue that this assertion is questionable. Using examples related to preservation versus development, hunting versus animal rights, and controversies over pest control, we show that, because ecology is conceptually and theoretically underdetermined, environmental values often influence the practice of ecological science. KEYWORDS: animal rights, balance of nature, community, ecology ecosystem, pest control, science, stability, values. Shrader-Frechette is in philosophy at the University of South Florida. McCoy is in biology at the University of South Florida, Tampa. (EV)

Shrader-Frechette, Kristin, "Individualism, Holism, and Environmental Ethics," Ethics and the Environment 1(no.1, 1996):55-69. Neoclassical economists have been telling us for years that if we behave in egoistic, individualistic ways, the invisible hand of the market will guide us to efficient and sustainable futures. Many contemporary Greens also have been telling us that if we behave in holistic ways, the invisible hand of ecology will guide us to healthy and sustainable futures. In this essay, I argue that neither environmental individualism nor first-order environmental holism--to which many ecologists and environmentalists appear to subscribe--will provide environmental sustainability. There is no invisible hand, either in economics or in ecology. Humans have no guaranteed "tenure in the biosphere"

(Passmore 1974, 75-96). Likewise there is no philosophical "quick fix" for planetary problems, either through the environmental individualism of Feinberg, Frankena, and Regan, or through the first-order environmental holism of Callicott and Leopold. The correct path is more complex and tortuous than either of these ways. I argue that the most ethically defensible way to reach planetary protection and a sustainable environmental future probably is through a middle path that I describe as "hierarchical holism." Shrader-Frechette teaches philosophy at the University of South Florida, Tampa. (E&E)

Shrader-Frechette, Kristin and Earl McCoy, "What Ecology Can Do for Environmental Management," Journal of Environmental Management 41(1994). (v5,#3)

Shrader-Frechette, Kristin S. and Earl D. McCoy, Method in Ecology: Strategies for Conservation. Cambridge University Press, 1993. 350 pages. Hardcover \$ 69.95. Paper, \$ 29.95. Philosopher Shrader-Frechette and ecologist McCoy examine the practical contributions ecology can and cannot make to applied science and environmental problem solving. Section I. Conceptual problems that have often prevented the formulation and evaluation of powerful, precise, general theories; why island biogeography is still beset with controversy; and the ways that science is value laden. "We are unable to define 'natural' in a way free of categorical values. We are unable to define it in a way recognized as part of science. Yet, it is part of science" (p. 103).

Section II. How ecology can give specific answers to practical environmental questions posed in individual case studies, and a new way to look at scientific error. A case study using the Florida panther is examined. There is a bright future for the important, but relatively underdeveloped task of applying ecology to practical environmental problem solving. Both authors are at the University of South Florida. (v4,#4)

Shrader-Frechette, Kristin and Earl McCoy, "Theory Reduction and Explanation in Ecology," Oikos 58 (no. 1, 1990):109-114. How ecology could benefit from incorporating some formal tools of philosophy. The reduction of ecological theories is premature. Some nonfalsifiable ecological principles are not scientific laws, subject to testing. Statistical laws and stochastic processes might provide the best grounds for the scientific stature of ecology. (v2,#3)

Shrader-Frechette, Kristin, "Review of Callicott, In Defense of the Land Ethic," Between the Species 6, no. 4, (Fall 1990): 185-189. With reply by Callicott, pp. 193-195, and reply by Shrader-Frechette, pp. 195-196. Argument and counterargument about whether ecosystems are communities with enough definiteness to serve as the object of moral duty, whether moral norms can be derived from behaviors to which humans are disposed by evolutionary heritage, and whether the extent of change of historical time prevents considering the stability of an ecosystem as a norm in environmental ethics. (v2,#3)

Shrader-Frechette, Kristin, "Risky business: nuclear workers, ethics, and the market-efficiency argument," Ethics and the Environment 7(no. 1, 2002):1-23. Workers generally face higher levels of pollution and risk in their work-place than members of the public. Economists justify the double standard (for workplace versus public exposures to various pollutants) on the grounds of the compensating wage differential (CWD). The CWD, or hazard-pay premium, is the increment in wages, all things being equal, that workers in hazardous environments receive, as compared to other workers. Economists defend the CWD by asserting that workers willingly trade safety for extra money. This essay (1) examines the theory behind the CWD, (2) presents and evaluates economists' Market-Efficiency Argument for the CWD (3) offers several reasons for questioning the CWD, and (4) applies the Market-Efficiency Argument to a real-world case, that of U.S. nuclear workers. The essay concludes that this argument fails to justify the CWD, at least in the case of U.S. nuclear workers. (E&E)

Shrader-Frechette, Kristin S., Burying Uncertainty: Risk and the Case Against Geological Disposal of Nuclear Waste. Berkeley: University of California Press, 1993. 326 pages. \$ 15.00 paper. \$ 40.00 cloth.

Argues that the current U.S. government policy of burying radwastes is profoundly misguided on both scientific and ethical grounds, because we cannot trust the precision of 10,000 year predictions and promise containment of the waste, and because geological disposal ignores the rights of present and future generations to equal treatment, due process, and free informed consent. The argument is focused on the world's first proposed high-level radioactive waste facility at Yucca Mountain, Nevada. Shrader-Frechette is professor of philosophy at the University of South Florida. Shrader-Frechette, Kristin, "Equity and Nuclear Waste Disposal", Journal of Agricultural and Environmental Ethics 7(1994):133-156. The US Department of Energy has proposed Yucca Mountain, Nevada as the site for the world's first permanent repository for high-level nuclear waste. This essay argues that considerations of equity (safer for whom?) undercut the safety rationale. The article surveys some prima facie arguments for equity in the distribution of radwaste risks and then evaluates four objections that are based, respectively, on practicality, compensation for risks, skepticism about duties to future generations, and the uranium criterion. The conclusion is that, at least under existing regulations and policies, permanent waste disposal is highly questionable, in part, because it fails to distribute risk

equitably or to compensate, in full, for this inequity. Shrader-Frechette is in philosophy at the University of South Florida, Tampa.

Shrader-Frechette, Kristin S., "Environmental Risk and the Iron Triangle," Business Ethics Quarterly 5(1995):753-777. There appears to be an iron triangle of industry, government, and consultant/contractors promoting the siting of the first permanent geological repository of high-level nuclear waste and spent fuel proposed for Yucca Mountain, Nevada. The iron triangle has ignored important epistemological and ethical difficulties with the proposed facility.

Shrader-Frechette, Kristin, "Scientific Method, Anti-Foundationalism, and Public Decisionmaking," I RISK--Issues in Health and Safety 23(Winter, 1990):23-41. Examines the failure of foundationalist positivism, how the experts are often wrong, and what lessons are to be learned from the experts' errors. (v2,#3)

Shrader-Frechette, Kristin and Earl D. McCoy, "Applied Ecology and the Logic of Case Studies," Philosophy of Science 61(1994)228-249. Because of the problems associated with ecological concepts, generalizations, and proposed general theories, applied ecology may require a new "logic" of explanation characterized neither by the traditional concepts of confirmation nor by the logic of discovery. Building on the works of Grünbaum, Kuhn, and Wittgenstein, the authors use detailed descriptions from research on conserving the Northern Spotted Owl, a case typical of problem solving in applied ecology, to (1) characterize the method of case studies; (2) survey its strengths; (3) summarize and respond to its shortcomings; and (4) investigate and defend its underlying "logic." Ecology is too complex to have many, or any, exceptionless laws, and there is no strict logic here, but there is a method of case study that makes sense of a situation, intelligently finding out such things as habitat characteristics required for nesting, owl population sizes able to withstand environmental fluctuations and genetic depression, and so forth. We can understand a local situation even though we cannot make scientific generalizations. Shrader-Frechette is in philosophy, McCoy in biology at the University of South Florida at Tampa. (v5,#2)

Shrader-Frechette, Kristin S., "Agriculture, Ethics, and Restrictions on Property Rights", Journal of Agricultural Ethics 1(1988):21-40. The argument is twofold. (1) Procedural justice requires, in particular cases, that we restrict property rights in natural resources, e.g., California agricultural land or Appalachian coal land. (2) Conditions imposed by Locke's political theory and by dense population require, in general, that we restrict property rights in finite or non-renewable natural resources such as land. If these arguments are right, then we have a moral imperative to use land-use controls in a far more radical way than has been done in the past. Shrader-Frechette is in philosophy at the University of South Florida, Tampa.

Shrader-Frechette, Kristin, Risk and Rationality: Philosophical Foundations for Populist Reforms (Berkeley: University of California Press, 1991). 272 pages. \$ 39.95 cloth. \$ 15.95 paper. Neither charges of irresponsible endangerment nor countercharges of scientific illiteracy in the public frame risk issues properly. Risk evaluation as a social process can be rational and objective, even though all risk-evaluation rules are value-laden. Shrader-Frechette defends "scientific proceduralism," a new paradigm for assessment when acceptance of public hazards is rational, recognizing that laypersons are often more rational in their evaluation of scientific risks than either experts or governments have acknowledged. Science need not preclude democracy. (v2,#3)

Shrader-Frechette, Kristin, Environmental Justice: Creating Equity, Reclaiming Democracy. New York:

Oxford University Press, 2002. Fundamental ethical concepts such as equality, property rights, procedural justice, free informed consent, intergenerational equity, and just compensation. How these core concepts have been compromised for a large segment of the global population, among them Appalachians, African-Americans, workers in hazardous jobs, and indigenous people in developing nations. Burdens like pollution and resource depletion need to be apportioned more equally, and there are compelling ethical grounds for remedying our environmental problems. Those affected by environmental problems must be included in the process of remedying those problems; all citizens have a duty to engage in activism on behalf of environmental justice. Shrader-Frechette is in philosophy, University of Notre Dame.

Shrader-Frechette, Kristin, "Ecological Explanation and the Population-Growth Thesis," PSA 94, ed. Peter Asquith. East Lansing, MI: Philosophy of Science Association, 1994. Many ecologists have dismissed alleged ecological laws as tautological, trivial, circular, or nontestable. This essay investigates the status of one of the most prominent such "laws," the population-growth thesis. The essay argues that some interpretations of the thesis are not obviously a priori, trivial, definitional, or tautological, although the thesis itself may be used in some context that are a priori. The essay closes with several observations about what the epistemological status of the population-growth thesis, as a schematic law, might tell us about explanation in ecology. Shrader-Frechette is in philosophy at the University of South Florida, Tampa. (v5,#3)

Shrader-Frechette, Kristin, Ethics of Scientific Research. Lanham, Md: Rowman and Littlefield, 1994. 208 pages. \$ 54.50 cloth; \$ 21.95 paper. Chapters: Importance of Research Ethics; The Duty to Do Research; Basic Principles of Research Ethics; Objectivity; Promoting the Public Good; Handling Conflicts; Research and Uncertainty; Uncertain Science in Controversial and Litigious Times. With three concluding chapters by other authors: Helen Longino, "Gender and Racial Biases in Scientific Research"; Carl Mitchem, "Engineering Design Research and the Public Good"; Carl Cranor, "Public Health Research and Uncertainty." Shrader-Frechette is in philosophy at the University of South Florida, Tampa. (v5,#3)

Shrader-Frechette, Kristin. *Taking Action, Saving Lives: Our Duties to Protect Environmental and Public Health*. Oxford: Oxford University Press, 2007. Shrader-Frechette argues that the United States government has failed to protect its citizens from industrial and agricultural toxins that disproportionately poison children, the poor, and minorities because campaign contributors, lobbyists, and politicians and their power over advertising, media, and public relations, along with well-funded polluters and special interests that capture science and regulators themselves, have conspired to cover up environmental disease and death. She claims, however, that the blame for this should be placed upon ordinary citizens that in a democracy have duties to remain informed about and involved in public health and environmental decision-making and to help prevent avoidable environmental deaths. She calls for a new democratic revolution to accomplish this.

Shrader-Frechette (Shrader-Frechette), Kristin, "Ethical Theory Versus Unethical Practice: Radiation Protection and Future Generations," Ethics and the Environment 3(1998):177-195. The main international standard-setting agencies for ionizing radiation, the International Atomic Energy Agency (IAEA) and the International Commission on Radiological Protection (ICRP) both subscribe to principles which (they claim) lead to equitable protection for all generations exposed to radioactive pollution. Yet,

when one examines the practices both groups support, it is clear that these practices discriminate against future generations with respect to radioactive pollution. After showing (1) that the IAEA and ICRP rhetoric of equity does not match their policies and practices, the essay argues (2) that current people ought to try to treat members of future generations equitably with respect to protection from radioactive pollution. The essay also argues (3) that current policies of permanent disposal of high-level radioactive waste do not meet the second criterion, and therefore (4) that society ought to investigate whether another strategy for managing the waste would provide better equal protection among all generations. Shrader-Frechette is in philosophy, University of Notre Dame, Notre Dame, IN. (E&E)

Shreeve, James, "Machiavellian Monkeys," Discover, June 1991. A close look at our close relatives shows how important sneakiness and deceit have been in human evolution. Richard Byrne and Andrew Whitten, Scottish psychologists at the University of Saint Andrews, claim that nearly all primates practice tactical deception, some elaborately. Except for lemurs, the primate species are "a simian rogues' gallery of liars and frauds." "The sneakier the primate ... the bigger the brain." A conclusion is that the human brain evolved as an organ of deceit. With chimpanzees there are episodes where one chimpanzee uses deceit to expose the deceit of another. "Society, sneakiness, brain size, and intelligence are intimately bound up with one another." Deceptive episodes often involve hiding food or mating with females. Critics reply that the primates may be naturally selected for such behaviors, but that there is less intentionality than supposed by transference from apparently similar human behavior. (v2,#3)

Sibary, Scott and Jane Kerlinger, "Pollution Control and Free Trade," Illahee: Journal for the Northwest Environment 10 (no. 3, fall 1994):181-191. Excellent introduction to the issues of fairness in the free trade - environmental regulations debate. Free trade allows unfair competition, if one considers the distribution of harms resulting when national standards of environmental protection differ. A polluting business in a lesser regulated nation can shift the costs of its production onto other persons in that nation, not party to the business transaction, and gain relatively to businesses in regulated (often developed) countries that, owing to environmental regulation, do internalize the costs of pollution. Also, this is market inefficiency. With application to NAFTA and GATT, somewhat dismaying. The authors recommend a scheme of countervailing duties, but they realize the many complexities. A good article to introduce these issues to students, if not to yourself. Sibary is an attorney and professor of management at California State University, Chico. Kerlinger is an engineer in geosciences, also at Chico. (v5,#4)

Sideris, Lisa H., Environmental Ethics, Ecological Theology, and Natural Selection. New York: Columbia University Press, 2003. A searching critique of ecological theologies, particularly of their compatibility with Darwinian evolutionary natural history. Examines the works of such influential thinkers as James Gustafson, Sallie McFague, Rosemary Radford Ruether, John Cobb, Peter Singer, and Holmes Rolston. Sideris argues for a more realistic (and less romantic) ethic that combines evolutionary theory with theological insight. She engages an impressive array of contemporary thinkers, with a constructive agenda: to balance scientific, philosophical, and theological concerns. This book was featured in an "Author Meets Critics" session at APA, Pasadena, March 2004. Sideris is at the McGill School of Environment and the Faculty of Religious Studies, McGill University, Montreal. (v. 15, # 3)

Sideris, Lisa H., The Limits of Theodicy: Ecological Theology, Natural Selection, and the Problem of Suffering in Nature, Ph.D. dissertation, Department of Religious Studies, Indiana University, 2000. A critical examination of Christian environmental ethics. Much ecological theology has ignored natural science, particularly evolutionary perspectives. This neglect produces practical and theoretical problems, many of which revolve around the problem of suffering in nature, and whether it can and ought to be eradicated. Invoking an ecological model of nature that resembles pre-Darwinian and Romantic views, such ethicists issue an imperative to love and liberate nature from a suffering which is, in fact, integral to nature. Sideris proposes an alternative approach that incorporates elements of science and theology, arguing that it is possible to extend a qualified, less-interventionist, and more discriminating ethic of love to nature. The advisor was Richard B. Miller. (v.12,#3)

Siipi, H., Naturalness, Unnaturalness and Artifactuality in Bioethical Argumentation. Turku, Finland: University of Turku, 2005.

Siipi, Helena, Review of: Aitken, Gill, A New Approach to Conservation: The Importance of the Individual through Wildlife Rehabilitation. Aldershot: Ashgate, 2004. Environmental Values 14(2005):527-529.

Siipi, Helena, "Naturalness in Biological Conservation," *Journal of Agricultural and Environmental Ethics* 17(2004):457-477. Conservation scientists are arguing whether naturalness provides a reasonable "imperative" for conservation. To clarify this debate and the interpretation of the term "natural," I analyze three management strategies - ecosystem preservation, ecosystem restoration, and ecosystem engineering - with respect to the naturalness of their outcomes. This analysis consists in two parts. First, the ambiguous term "natural" is defined in a variety of ways, including (1) naturalness as that which is part of nature, (2) naturalness as a contrast to artifactuality, (3) naturalness as an historical independence from human actions, and (4) naturalness as possession of certain properties. After that, I analyze the different conceptions with respect to their implications for the three management strategies. The main conclusion is that there exists no single conception of naturalness that could distinguish between the outcomes of the three management methods. Therefore, as long as the outcomes of the different methods are regarded as being of a different value in conservation, we should either abandon the idea of naturalness as the guiding concept in conservation or use the term "natural" only in the ways that take both its historical and feature dependent meanings into consideration. Keywords: conservation, restoration, unnaturalness. Keywords: ecosystem engineering, naturalness, preservation. Siipi is in the Department of Philosophy, University of Turku, Finland. (JAEE)

Siipi, Helena, "Artefacts and Living Artefacts," *Environmental Values* 12(2003): 413-430. The concept of an artefact is central to several bioethical arguments. In this paper, I analyse this concept with respect to living and also non-living entities. It is shown that a close relationship between bringing an entity into existence and its intentional modification is necessary for its artefactuality. The criterion is further improved by analyses of the nature of intentionality in artefact production and the differences between artefacts and their side-effects. Further, in order to clarify the meaning of the term 'bring into existence', issues related to sortal terms and functions of artefacts are considered. As the result of these analyses, the criterion for being an artefact is founded on the following double condition: (1) An entity x is an artefact only if x has been intentionally brought into existence by intentionally causing the coming artefact x to have certain properties. (2) An entity x is an artefact only if causing x to have certain properties has led x to have some new functions - that is, functions that are not present in the raw materials of x. The double condition is used for clarifying the status of several biotic entities such as gardens, commercial fields, polluted natural areas, ecosystems including alien species, restored ecosystems and transgenic organisms. (EV)

Siipi, Helena, and Susanne Uusital, "Consumer Autonomy and Sufficiency of GMF Labeling," *Journal of Agricultural and Environmental Ethics* 21(2008):353-369. Individuals' food choices are intimately connected to their self-images and world views. Some dietary choices adopted by consumers pose restrictions on their use of genetically modified food (GMF). It is quite generally agreed that some kind of labeling is necessary for respecting consumers' autonomy of choice regarding GMF. In this paper, we ask whether the current practice of mandatory labeling of GMF products in the European Union is a sufficient administrative procedure for respecting consumers' autonomy. Three issues concerning this question are discussed. First, we argue that labeling needs to be accompanied by relevant and understandable information on genetic modification, genetically modified food, and the European practice of GMF labeling. Second, we claim that this type of informing makes it less likely that consumers start to avoid GMF products just because labels make them suspicious of the products. It is further noted that even though some consumers may react to labels this way, labels do not restrict their autonomy of choice. Third, a need for more precise labels indicating the source of the transferred gene is considered. It is found out that such labels are not morally necessary when also non-GMF products are available and no relevant differences (such as differences in price and healthiness) exist between them and GMF products. However, in some other cases more precise labels may be needed for respecting consumers' autonomy of choice. The authors are in the Department of Philosophy, University of Turku, Turku, Finland.

Siipi, Helena, "Dimensions of Naturalness," *Ethics and the Environment* 13(no. 1, 2008):71-103. This

paper presents a way of classifying different forms of naturalness and unnaturalness. Three main forms of (un)naturalness are found as the following: history-based (un)naturalness, property-based (un)naturalness and relation-based (un)naturalness. Numerous subforms (and some subforms of the subforms) of each are presented. The subforms differ with respect to the entities that are found (un)natural, with respect to their all-inclusiveness, and whether (un)naturalness is seen as all-or-nothing affair, or a continuous gradient. This kind of conceptual analysis is needed, first, because discussion concerning (un)naturalness is common in current bioethics and environmental ethics, and second, because the terms natural and unnatural are highly ambiguous. Thus, the lack of an exact definition of the type of (un)naturalness may lead into equivocation, other forms of bad argumentation, or at least vagueness. Helena Siipi earned her doctorate in philosophy in 2005. She now works as a researcher in University of Turku, Finland.

Silver, Lee M., Challenging Nature: The Clash of Science and Spirituality at the New Frontiers of Life. New York: Ecco (Harper Collins), 2006. An unabashed sales pitch for our biotechnological future. "Human nature will remake all of Mother Nature. The ultimate question--the very asking of which strikes fear into the hearts of many people--is whether or not the human spirit or soul will stay the same or be remade in the process as well." Humans will increasingly have no need of original nature, since they have remade nature. There are no anthropocentric reasons for saving nature, but, interestingly, Silver does think there may be moral reasons. In fact, he holds, there is no defensible reason for the conservation of species except because we think species preservation is a moral imperative. Silver is in molecular biology at Princeton University. His field, he declares is, "compared with every other field of scholarship and science ... the least compatible with spiritual beliefs."

Silverman, Victor, "Green Unions in a Grey World: Labor Environmentalism and International Institutions," Organization and Environment 19 (no. 2, June 2006): 191-209. International labor environmentalism, a significant innovation in global politics, centers on the role of the International Confederation of Free Trade Unions at the United Nations Commission on Sustainable Development and other bodies. Unions face multiple challenges in international institutions, for example, from partnerships that privatize government functions and from disagreements within unions, but this article nonetheless finds that environmentalism arising from the character of trade unions and the ideology of leaders has great potential. Silverman is associate professor of history at Pomona College, Claremont, California.

Silvertown, Jonathan, Demons in Eden: The Paradox of Plant Diversity. Chicago: University of Chicago Press, 2006. A survey of plant biodiversity and the reasons why. The paradox is that, on Darwinian natural selection, one might suppose that ever fewer plants (the "demons in eden") would get ever better at outcompeting the others and displace them. But that does not happen; rather the other way round: there is steady increase of biodiversity. Although plants may go through a demon phase, they have to cope with many factors, the costs of growth and reproduction, limited resources, competition from and dependence on others, predation, and the result is vast diversity.

Covelo, CA: Island Press, 1997. 480 pp. \$50 cloth, \$29.95 paper. An examination of the Florida severe exotic species problems and of the ongoing efforts to eradicate or manage introduced species covering millions of acres of land and water. (v8,#2)

Simberloff, Daniel, "Biological Invasions--How Are They Affecting Us, and What Can We Do about Them?" Western North American Naturalist 61(no. 3, 2001):308-315. Nonindigenous species affect native ecosystems, communities, and populations in myriad ways, from plants (and a few animals) that overgrow entire communities, to plants and animals that hybridize individual native species to a sort of genetic extinction. Further, nonindigenous species sometimes interact to worsen each other's impact. These impacts are commonly seen in national parks throughout the United States.

The key policy change required to alleviate this threat is a shift from blacklists of prohibited species and a presumption of harmlessness to a combination of white and blacklists and a presumption that any species may be damaging. This new guiding philosophy must be inculcated at international and national levels, which will not be easy during a period when free trade is seen as an unmitigated blessing. Within the United States, enhanced cooperation and coordination will be required among all parties (i.e. federal, state, and local agencies as well as private entities) charged with managing invasions. Internationally, the key forum is the World Trade Organization.

Various management tools available to combat nonindigenous species have produced some striking successes, but new research could improve their effectiveness and reliability. There is a particular need for research on ecosystem management to control introduced species. In the face of the increasingly publicized onslaught of invaders, there is a widespread tendency to view increased biotic homogenization as inevitable. However, advances in both policy and technology could greatly slow this process and perhaps (in consort with restoration measures) even reverse it. The necessary pressure and resources to effect these changes must come from an increasingly alarmed and vocal public. Simberloff is in ecology and evolutionary biology, University of Tennessee, Knoxville. (v.12,#3)

Simberloff, Daniel, and Stiling, Peter, "Risks of Species Introduced for Biological Control," Biological Conservation 78(1996):185-192. Also: "How Risky is Biological Control?" Ecology 77(1996):1965-1974. Numerous biological control introductions have adversely affected non-target native species. Cost-benefit analysis for conservation are difficult because it is difficult to assign values to the various tradeoffs. Risk assessment is difficult because it is difficult to predict outcomes. Better consideration is needed to myriad factors that now often receive cursory attention. Simberloff is in biology, Florida State University, Tallahassee. Stiling is in biology, University of South Florida, Tampa. (EE v.12,#1)

Simberloff, Daniel and Betsy Von Holle, "Positive Interactions of Nonindigenous Species: Invasional Meltdown?," Biological Invasions 1(1999):21-32. There are many studies of interactions between invasive species and indigenous species, but few studies of interactions between invasive species themselves. In this study, invasive species are found seldom to compete with each other detrimentally and frequently to facilitate each other. "There is little evidence that interference among introduced species at levels currently observed significantly impedes further invasions, and synergistic interactions among invaders may well lead to accelerated impacts on native ecosystems - an invasional 'meltdown' process." The authors are in ecology, University of Tennessee, Knoxville.

Simberloff, Daniel, "Non-native Species DO Threaten the Natural Environment!," Journal of Agricultural and Environmental Ethics 18(2005):595-607. Sagoff [Journal of Agricultural and Environmental Ethics 18 (2005), 215-236] argues, against growing empirical evidence, that major environmental impacts of non-native species are unproven. However, many such impacts, including extinctions of both island and continental species, have both been demonstrated and judged by the public to be harmful. Although more public attention has been focused on non-native animals than non-native plants, the latter more often cause ecosystem-wide impacts. Increased regulation of introduction of non-native species is, therefore, warranted, and, contra Sagoff's assertions, invasion biologists have recently developed methods that greatly aid prediction of which introduced species will harm the environment and thus enable more efficient regulation. The fact that introduced species may increase local biodiversity in certain instances has not been shown to result in desired changes in ecosystem function. In other locales, they decrease biodiversity, as they do globally. Keywords biodiversity - ecosystem function - introduced species - invasion - non-native species - prediction - risk assessment - Sagoff. Simberloff is in the Department of

Ecology and Evolutionary Biology, University of Tennessee, Knoxville. (JAEE)

Simmons, Aaron. "A Critique of Mary Anne Warren's Weak Animal Rights View." *Environmental Ethics* 29(2007):267-278. In her book, *Moral Status*, Mary Anne Warren defends a comprehensive theory of the moral status of various entities. Under this theory, she argues that animals may have some moral rights but that their rights are much weaker in strength than the rights of humans, who have rights in the fullest, strongest sense. Subsequently, Warren believes that our duties to animals are far weaker than our duties to other humans. This weakness is especially evident from the fact that Warren believes that it is frequently permissible for humans to kill animals for food. Warren's argument for her view consists primarily in the belief that we have inevitable practical conflicts with animals that make it impossible to grant them equal rights without sacrificing basic human interests. However, her arguments fail to justify her conclusions. In particular, Warren fails to justify her beliefs that animals do not have an equal right to life and that it is permissible for humans to kill animals for food. (EE)

Simmons, I.G., "Bach's Butterfly Effect: Culture, Environment and History," Environmental Values 6(1997):483-497. ABSTRACT: The basic thesis that environmental values must spring from the economic relations of human societies is examined and it is suggested that although such connections are never absent, they do not account for the totality of values. Rather, they interact with other values in a kind of helical strand which is open-ended and self-organising. In such a context, sustainability, for example, becomes a rather time-limited idea. Our present ways of describing such evolution and interactions are also briefly examined. Department of Geography University of Durham, Science Labs, South Road, Durham DH1 3LE, UK. (EV)

Simmons, Pam, "'Women in Development': A Threat to Liberation," The Ecologist 22(no. 1, January/February 1992):16-21. The call to integrate women into development has been taken up by the international development institutions to suit their own purposes. Adopted, as it invariably has been, in a simplistic form, it is a dangerous slogan that threatens to reduce Third World Women to "resources" for the international economy. It also wrongly implies that women in industrialized countries are progressing to a position of equality. Simmons works with women's issues through NGO's in Australia and Thailand. Also Simmons in this issue reviews ten books on feminism, environment, development, and technology. (v5,#2)

NJ: Transaction Publishers, Rutgers, 1996. 591 pp. \$28.95 paper. Fifty-eight essays, on population, raw materials, energy, food supply, and pollution, by perhaps the worlds most optimistic developmentalist. (v7,#4)

Simon, Julian L. *Hoodwinking the Nation*. New Brunswick, NJ: Transaction Publishers, 2006. The now-late Julian Simon continues to make his case that population growth is not a problem, we are not running out of natural resources, and the environment is not becoming more polluted. His goal in this final book is to examine why the media reports so much false and bad environmental news. Simon argues that government reports are often the basis for doomsday analyses and environmental news scams, biologists tend to become falsely and overly alarmed about mythical environmental scares, and politicians misuse statistics in the service of their own political and policy goals. All of this is compounded by the facts that cultural and psychological mechanisms make people receptive to bad news instead of good news and that most people have too positive a view about the past and too negative a view about the future.

Simon, Noel, Nature in Danger: Threatened Habitats and Species. New York: Oxford University Press, 1996. (v7,#2)

Simon, Thomas W., "Varieties of Ecological Dialectics," Environmental Ethics 12(1990):211-231. One of the few articles to appear in this journal that uses Marxist analysis---dialectics---to understand environmental thought. Simon looks at Marxist, anarchist, and Native American approaches to solving the environmental crisis. He argues for a synthesis using the dialectical frameworks of politics, history, ethics, ecology, and spirituality. (Katz, Bibl # 2)

Simon, Thomas W. "Varieties of Ecological Dialectics." Environmental Ethics 12(1990):211-31. A hierarchical ordering of approaches afflicts environmental thinking. An ethics of individualism unjustly overrides social/political philosophy in environmental debates. Dialectics helps correct this imbalance. In dialectical fashion, a synthesis emerges between conflicting approaches to dialectics and to nature from: Marxism (Levins and Lewontin), anarchism (Bookchin), and Native Americanism (Black Elk). Conflicting (according to Marxists) and cooperative (according to anarchists) forces both operate in nature. Ethics (anarchist), political theory (Marxist), and spirituality (Native American) constitute the interconnected interpretative domains of a dialectically informed ecophilosophy. In a world painted too often in blacks and whites, ecological dialectics colors the picture a more realistic gray. Simon is in the philosophy department, University of Illinois at Urbana-Champaign, Urbana, IL. (EE)

Simonis, Udo E. "Internationally Tradeable Emission Certificates: Efficiency and Equity Linking Environmental Protection with Economic Development." Ethics and the Environment 5(2000):61-76. Abstract: 1. THE IDEA AND ITS POLITICAL CONTEXT: With respect to the formulation and implementation of a global climate policy, the "Berlin Mandate," the most important concluding document of the first Conference of the Parties to the Framework Convention on Climate Change, adopted on 7 April 1995, says the following: The Parties should protect the climate system for the benefit of present and future generations of humankind. on the basis of equity and in accordance with their

common but differentiated responsibilities and respective capabilities ... The global nature of climate change calls for the widest possible cooperation by all countries ... ; developed countries [should] set quantified target limitation and reduction objectives within specified time frames, such as 2005, 2010, and 2020. Finally, it states that "the process should begin without delay" (Berlin Mandate 1995, italics added). As regards "joint implementation," an instrument which affects both industrialized and developing countries, the Conference of the Parties decided to establish a pilot phase for activities implemented jointly among Annex I Parties and, on a voluntary basis, with non-Annex I Parties that so request internationally tradeable emission certificates. During this pilot phase, a framework should be established "for reporting." (E&E)

Simons, John, "The Longest Revolution: Cultural Studies after Speciesism," Environmental Values 6(1997):483-497. ABSTRACT: This article is a provisional exploration of the field of cultural studies from a committed animal rights perspective. It argues that cultural studies will need to be reformed in response to increasing public concern about animal welfare issues and the growth of environmental consciousness. A number of critical readings of literary texts are employed to exemplify how this reformation might manifest itself in practice. It includes a review and critique of some current work in the field and suggests that cultural theory is presently unable to respond fully to the place of animals in cultural production. (EV)

Simonsen, Kenneth H. "The Value of Wildness." Environmental Ethics 3(1981):259-63. In his article, "The Nature and Possibility of an Environmental Ethics," Tom Regan says that the fitting attitude toward nature "is one of admiring respect." What follows is an attempt to discover what in nature should impel us to respond in this way. Ultimately I argue that the value of wild nature is found in the fact that it has emerged spontaneously, independent of human designs. Simonsen is in the department of philosophy, College of Lake Country, Grayslake, IL. (EE)

Simpson, Juanita Mae, The Theoretical Foundations for an Environmental Ethic (Intrinsic Value), 1997, University of Arizona, Ph.D. thesis. 223 pages. An analysis of the concept of intrinsic value as a foundation for an environmental ethic. Distinguishes between a metaphysical conception of intrinsic value, having to do with its ontological status, and a normative conception which pertains solely to questions of normativity and moral obligation. There is a symmetry between certain earlier metaethical dialogues (Sidgwick and Moore) and the recent debates in environmental value theory. The latter-day Last Person thought experiment mirrors the challenge given by Sidgwick to which Moore responded with

his Beautiful World analysis. Theorists have conflated a requirement for a noninstrumentalist (intrinsic) value with the requirement for a strongly objectivist ontology for value. Hence, theorists believed that what was required was a nondispositionalist, internal notion of value, abstracted from any possible evaluative stance. This confusion is expressed in the contemporary environmental ethics. Quinn offers a revised theoretical framework for an environmental ethic. The advisor was Joel Feinberg. (v.10,#1)

Simpson, R. David, Roger A. Sedjo, and John W. Reid, "Valuing Biodiversity for Use in Pharmaceutical Research," Journal of Political Economy 104 (no. 1, February 1996):163-185. The expected value of a new species for pharmaceutical purposes is very low, so low as to make it unlikely that private firms will have much economic incentive to protect species. Also, the loss--measured in human illness or death--caused by the loss of a species is likely to be small. Even under the most optimistic assumptions, the economic value of saving one species is unlikely to be more than about \$ 10,000, and under typical assumptions the probability that a given species will yield useful discoveries drops its expected value to less than \$ 100. Issues of ecological, moral, or aesthetic values are not here considered. (v8,#3)

Simpson, R. David, "Biodiversity Prospecting: Shopping the Wilds Is Not the Key to Conservation," Resources (Resources for the Future), Winter, 1997, pp. 12-15. Studies show that losses in biological diversity have little bearing on whether the next miracle drug will be found. There are so many wild plants and animals that can be used by researchers that sources of useful products are either so common as to be redundant or so rare as to make discovery unlikely. The reasons for saving biodiversity can include such uses, but need to emphasize even more how biodiversity provides the basic life support system for society, and the aesthetic, ethical, and spiritual benefits. Simpson is an RFF fellow, writing a book in this area. (v8,#1)

Simus, Jason. "Environmental Art and Ecological Citizenship." *Environmental Ethics* 30(2008):21-36. Environmental artworks are not an aesthetic affront against nature because the aesthetic qualities of artworks are to some extent a function of other sorts of qualities, such as moral, social, or ecological qualities. By appealing to a new ecological paradigm, we can characterize environmental artworks as anthropogenic disturbances and evaluate them accordingly. Andrew Light's model of ecological citizenship emphasizes public participation in ecological restoration projects, which are very similar to environmental artworks. Participation in the creation, appreciation, and criticism of environmental art can count as a form of ecological citizenship when these practices provoke public deliberation about environmental and other community-regarding values.(EE)

Sinclair, A.R.E., Arcese, Peter, eds. Serengeti II: Dynamics, Management, and Conservation of an Ecosystem. Chicago: University of Chicago Press, 1995. 680 pp. \$90 cloth, \$34 paper. Follows a previous Serengeti, with twenty years of research by leading scientists and provides a sophisticated study of the Serengeti-Mara ecosystem in East Africa, home to one of the largest and most diverse populations of animals in the world. There are studies of the ecosystem at every level from the plants at the bottom of the visible food chain, to the many species of herbivores and predators, to the system as a whole. (v8,#2)

Sinclair, Patti K., E for Environment: An Annotated Bibliography of Children's Books with Environmental Themes. R. R. Bowker. 292 pages, \$ 39.95. Of special interest to elementary school teachers, environmental educators, librarians, parents, and those interested in teaching environmental ethics to children. Covers a wide range of material, from picture books that help instill in young readers a sense of wonder at the natural world, on through meatier nonfiction and fiction for older children. Author, title and subject indices, as well as a list of environmental classics for older students and adults. Harcourt Brace Jovanovich has launched a series of children's books dedicated to promoting ecological awareness: Gulliver Green Books. (v3,#4)

Singer, Brent A., "An Extension of Rawls' Theory of Justice to Environmental Ethics," Environmental Ethics 10(1988):217-231. An attempt to use a Rawlsian theory of justice to develop specific moral duties of an environmental ethic---the protection of essential elements (such as air, water, and land), and the consideration of animal interests. The approach is highly anthropocentric, based on human interests and what humans would require for a good society. (Katz, Bibl # 2)

Singer, Brent A. "An Extension of Rawls' Theory of Justice to Environmental Ethics." Environmental Ethics 10(1988):217-31. By combining and augmenting recent arguments that have appeared in the literature, I show how a modified Rawlsian theory of justice generates a strong environmental and animal rights ethic. These modifications include significant changes in the conditions of the contract situation vis-a-vis A Theory of Justice, but I argue that these modifications are in fact more consistent with Rawls' basic assumptions about the functions of a veil of ignorance and a thin theory of the good. Singer is in the philosophy department, University of Maine, Orono, ME. (EE)

Singer, Peter, "Heavy Petting," Review of Midas Dekkers, Dearest Pet: On Bestiality, in Nerve. Peter Singer on having sex with animals. Not natural, not normal, perhaps, but not undignified. In the online sex magazine Nerve, with the title "Heavy Petting," Singer reviews Dearest Pet: On Bestiality, by Midas Dekkers, a Dutch biologist, and suggests that the next taboo that should crumble is that against having sex with animals. He concludes: "This does not make sex across the species barrier normal, or natural, whatever those much-misused words may mean, but it does imply that it ceases to be an offense to our status and dignity as human beings." Consistent in his utilitarianism, what counts is pleasure or pain. Singer condemns sex with animals that pains them, for example copulating with a chicken, using the hen's cloaca and decapitating the hen. But then he doubts whether this is really worse (causing more suffering) than the routine practice of keeping hens in battery cages and eating them. Singer is in ethics at Princeton University. The review is online at:

Singer, Peter, One World: The Ethics of Globalization. New Haven, CT: Yale University Press. 2002. Changes are posing new ethical and organizational challenges that push moral thought and human institutions in unprecedented directions, involving the economy, the environment, international law, and community. Complex environmental questions are not confined to individual nations and cannot be addressed effectively within nation states. On the principle that "he who harms pays," "the United States and other rich nations should bear much more of the burden of reducing greenhouse gases than the poor nations--perhaps even the entire burden."

We need to "think about developing institutions or principles of international law that limit national sovereignty." The World Trade Organization is much to be faulted but something like a transformed version of it may be necessary. It is "possible to imagine a reformed WTO in which the overwhelming commitment to free trade is replaced by a commitment to more fundamental goals." Something like a democratic concept of a sovereign state has evolved: "the 'democratic concept of legitimate government' in which the concept of national sovereignty carries no weight if the government rests on force." "A global ethics should not stop at, or give great significance to, national boundaries. National sovereignty has no intrinsic moral weight." Singer is in ethics at Princeton University.

Singer, Peter, "Rights and Wrongs," interview by Erika Check, Nature 437(1 Sept. 2005):21, in a section "What the Chimp Means to Me," accompanying an issue announcing the sequencing of the chimpanzee genome. One of four who so reflect there. With half a dozen other related articles. Singer advocates (with the Great Ape Project) three "human" rights also to be granted to apes, the right to life, to liberty, and to protection from torture. (Singer, a utilitarian, seems to use "rights" language here more freely than elsewhere.) He also thinks that our human respect for life is not based on our genetic similarity with them. "I don't think that knowing which genes chimps share with us actually determines anything about their moral status in any meaningful way." Gary Marcus, in another interview, insists that there be great respect for chimps, but not under the pretense that they have language. "Chimpanzees may be many things, but linguists they are not."

Singer, Peter, "Ethics and Climate Change: A Commentary on MacCracken, Toman and Gardiner," Environmental Values 15(2006): 415-422. Climate change is an ethical issue, because it involves the distribution of a scarce resource - the capacity of the atmosphere to absorb our waste gases without producing consequences that no one wants. Various principles might be used to decide what distribution is just. This commentary argues that on any plausible principle, the industrialised nations should be doing much more than they are doing now, and much more than they are required to do by the Kyoto protocol, to reduce their greenhouse gas emissions. The commentary also responds specifically to some issues raised by MacCracken, Toman and Gardiner, including feasibility, the discount rate, and grounds for pessimism. (EV)

Sinha, Rajiv K., Margaret Greenway, Green Technologies for Environmental Management and Sustainable Development. New Delhi, Akhil Books, 2004. Website: www.akhilbooks.com E-mail: info@akhilbooks.com. Technologies of the 20th century promoted rapid socio-economic development and improved the quality of life of the people. But it was not without a price. All the basic life-support systems on earth-air, water and food-started getting poisoned in the wake of material development threatening our sustainability and survival. This called for a change in the strategy of development and the technologies applied. Sustainable human society on earth with "good quality of life for all" can be achieved either by persuading people to change their behaviour and attitude to life and give up the culture of consumerism or by promoting sustainable development programmes with appropriate environmental technologies. Rajiv K. Sinha is teaching environmental science/technology at the School of Environmental Engineering, Griffith University, Brisbane, Australia. He was formerly teaching similarly in India. Margaret Greenway is Associate Professor and an Ecological Engineer, School of Environmental Engineering at Griffith University, Australia.

Sinha, Rajiv K., "Embarking on the Second Green Revolution for Sustainable Agriculture in India: A Judicious Mix of Traditional Wisdom and Modern Knowledge in Ecological Farming," Journal of Agricultural and Environmental Ethics 10(1997/1998):183-197. ABSTRACT: The Green Revolution in India which was heralded in the 1960's was a mixed blessing. Ambitious use of agro-chemicals boosted food production but also destroyed the agricultural ecosystem. Of late Indian farmers and agricultural scientists have realized this and are anxious to find alternatives--perhaps a non-chemical agriculture--and have even revived their age-old traditional techniques of natural farming. Scientists are working to find economically cheaper and ecologically safer alternatives to agro-chemicals. BlueGreen Algae Biofertilizers, Earthworm Vermicomposts (Vermiculture), biological control of pests and herbal biopesticides are showing promise. Saline agriculture and sewage farming are also being promoted in India to augment food production in the face of water scarcity. There is a move to search for alternative foods, which are more nutritious, cheaper and have shorter harvest cycles. Farm and food policy in India has to change its outlook before there can be a second green revolution. KEY WORDS: BGA biofertilizer, vermicompost, biological pest control, saline agriculture, sewage farming, Spirulina algal food, traditional agriculture. (JAEE)

Sippola, Anna-Lisa, Pirho Alaraudanjoki, Bruce Forbes, and Ville Hallikainen, eds., Northern Wilderness Areas: Ecology, Sustainability, Values. Rovaniemi, Finland: Arctic Centre, University of Lapland (P. O. Box 122, 96101 Rovaniemi, Finland), 1995. 438 pages. \$ 30. One emphasis is that what seems a remote wilderness to outsiders was home to various aboriginal peoples and other residents. Such regions are now frequently under threat by development interests; the threats are unevenly distributed but the impact can be heavy. 44 authors. (v8,#2)

Sirico, Robert A., "The False Gods of Earth Day," Wall Street Journal, April 22, 1994. Environmentalism has become a religion, infecting the churches, and it worships false gods, with many followers in mainstream churches, also including Albert Gore, Vice-president of the United States. One result is to undermine the positive result that economic growth has played in achieving the goals of religious ethics and concern for persons, and the role of religion in reforming persons in these economic and political systems and keeping them moral. "To make Earth Day a religious holiday forgets the primary purpose of traditional faith: to avoid personal sin and to attain salvation. To do this, man must obey God's law, as found in the 10 Commandments. There is no commandment against littering, but there is a very straightforward one about worshipping false gods." A good discussion editorial for classes in religion and environment. Paulist Father Sirico is with the Study of Religion and Liberty, Grand Rapids, Michigan. (v5,#2)

Deep ecology aims at a change of our self-consciousness, beyond technical environmentalism. We gain our self from interrelations with other beings. Therefore, the ruling exploitation of nature should give way to a moderate and fair dwelling in the world. The practical principle of dignity of all creatures asks for a cultural change that places market and profit ideas on a subordinate level. Knowing that we cannot exist without harming and consuming other beings, we still accept the challenge of promoting life, wherever possible. Culture stands for the constructive coping with this existential tension. (v.11,#2)

Siurua, Hanna, "Nature above People: Rolston and "Fortress" Conservation in the South," Ethics and the Environment 11(2006):71-96. Holmes Rolston III has argued that in some situations where the needs of starving people come into conflict with the protection of natural values, "we" ought to prioritize the latter. Focusing on the threat to pristine ecosystems and endangered species posed by overpopulation in developing countries, Rolston advocates the exclusion of human settlement and activity from the most fragile and valuable wild areas--a strategy sometimes termed "fortress conservation." This approach suffers from at least three serious faults. First, fortress conservation is regarded as an illegitimate imposition by many of the local people on whose cooperation the success of conservation initiatives depends, often leading to failure in terms of conservation objectives. Second, the assumption that conservation and the satisfaction of basic human needs are largely incompatible ignores evidence of widespread environmentally sustainable patterns of resource use. Finally, Rolston's appeal to "us," referring variously to concerned North Americans and to humanity as a whole, implicitly universalizes the preservationist value system of a Northern minority while excluding the values and voices of the people directly affected by the proposed conservation measures. Siurua is a graduate student in philosophy, Lancaster University, UK. (Eth&Env)

Sivaraksa, Sulak, "Development and Environment in Southeast Asia." Zygon 24 (1989): 429-436. Western-style development and modernization is destroying the environment of Southeast Asia. A convergence of core Asian traditions with a new non-mechanistic paradigm of science offers the best hope for a spiritual basis for development. (Katz, Bibl # 2)

Sivaramakrishnan, K., "Forest Co-management as Science and Democracy in West Bengal, India," Environmental Values 11(2002):277-302. This essay argues that important development and natural resource management initiatives that seek to expand meaningful participation by rural communities directly affected by such ventures can be usefully examined as democratic technologies. Drawing upon nearly two decades of experience designing, implementing, and researching forest co-management programs in India, the essay examines the analogous practices through which democracy and forest management science become contested regulatory ideals while creating the deliberative spaces in which post-Habermasian public spheres can be constructed. The analysis of disciplinary tendencies, bureaucratic transition, and emerging solidarities among historically marginalised groups responding to the performance of democracy and scientific forest management is used to offer revisions to the more sweeping critiques of technology as fundamentally anti-democratic. (EV)

Sivard, Ruth Leger, World Military and Social Expenditures, 15th, 1993 edition. 56 pages, a slim book with a lot of information in it. This document is produced annually by the independent research organization World Priorities, Inc., Box 25140, Washington, DC 2007. Published in translations in eight languages. Some findings: The developed countries spend as much on military power in a year as the poorest 2 billion people on Earth earn in total income. The developed countries in 1990 provided \$ 56 billion in economic aid to the poorer countries and sold \$ 36 billion worth of arms to them. At a cost of less than half their military expenditures, the developing countries could provide a package of basic health care services and clinical care that would save 10 million lives a year. World military spending in 1992 exceeded \$ 600 billion. U. S. military spending accounted for nearly half this amount, despite the fact that in the U.S. one person in seven lives below the poverty line and over 37 million people lack any form health care coverage. In his foreword, John Kenneth Galbraith writes, "With the end of the Cold War, military expenditure on the present scale is patently ridiculous." But, Garrett Hardin reminds us (see previous entry), it costs money to protect your lifeboat. And with all that money spent, there is precious little left for conservation. (v4,#4)

Sizer, Nigel. Profit Without Plunder: Reaping Revenue From Guyana's Tropical Forests Without Destroying Them. Washington, D.C.: World Resource Institute, 1995. 46pp. \$14.95 paper. This report, developed at the request of Guyana's President, Dr. Cheddi Jagan, explains how the country can reap

revenue from its forests without destroying them. Identifying seven key steps Guyana can take for sustainable forestry management, author Nigel Sizer provides both concrete proposals for immediate and long-term action and a comprehensive analysis of the country's forestry programs to date. (v8,#1)

Sjöländer-Lindqvist (Sjöländer-Lindqvist), Annelie, "Conflicting Perspectives on Water in a Swedish Railway Tunnel Project," Environmental Values 14(2005):221-239. The building of a railway tunnel through the Hallandsås ridge in the southwest of Sweden resulted in sinking groundwater levels and a toxic spill for the local community. As a result, this highly technological project expanded from the addressing of technological and economic issues of rail traffic and tunnel building to include issues of environmental harm and how to assess and manage the geology of the ridge. A central concern for local residents as well as for the developer has been how to view and interpret the resource of groundwater. This article focuses on groundwater as a boundary object, bordering the domains of the technologists and the local community. In this situation, technological understanding and knowledge confronts an experience-based understanding and a symbolic interpretation of the water resource. Sjöländer-Lindqvist is at Göteborg University, Göteborg, Sweden. (EV)

Skagen Ekeli, Kristian, "Environmental Risks, Uncertainty and Intergenerational Ethics," Environmental Values 13(2004):421-448. The way our decisions and actions can affect future generations is surrounded by uncertainty. This is evident in current discussions of environmental risks related to global climate change, biotechnology and the use and storage of nuclear energy. The aim of this paper is to consider more closely how uncertainty affects our moral responsibility to future generations, and to what extent moral agents can be held responsible for activities that inflict risks on future people. It is argued that our moral responsibility to posterity is limited because our ability to foresee how present decisions and activities will affect future people is limited. The reason for this is primarily that we are in a situation of ignorance regarding the pace and direction of future scientific and technological development. This ignorance reduces our responsibility in a temporal dimension because in most areas it is impossible to predict the interests and resource needs of future generations. In one area, however, we have fairly reliable knowledge about future people. It is reasonable to assume that future human beings will have the same basic physiological (physical and biological) needs as we have. On this basis, it is argued that we can be held responsible for activities causing avoidable damage to critical resources that are necessary to provide for future physiological needs. Furthermore, it is suggested that it is prima facie immoral to impose risks upon future generations in cases where the following conditions are fulfilled: (1) the risk poses a threat to the ability of future generations to meet their physiological needs, and (2) the risk assessment is supported by scientifically based harm scenarios. Ekeli is in philosophy, Norwegian University of Science and Technology, Trondheim, Norway. (EV)

Skakoon, Elizabeth. "Nature and Human Identity." *Environmental Ethics* 30(2008):37-49. In opposition to modernist conceptions of the "self," some environmental philosophers argue that human identity is first and foremost wild and natural because it is a product of an ontologically independent nature. They use evolutionary theory to create and maintain a division between our wild, natural human identity and our artificial culture. Their position is supported by a misunderstanding of both early hominid evolution and artifacts. Artifacts are not the neutral instruments of human will, but exist with us in "economies" that constantly create unintended consequences. In terms of recent work in the field of philosophical anthropology, a reexamination of the evolutionary evidence suggests that our identity is not natural but completely artificial. This artificial identity provides us with new ways of conceptualizing our present ecological problems. (EE)

Skelton, William H., ed., Wilderness Trails of Cherokee National Forest. Knoxville: University of Tennessee Press, 1992. 323 pages. Over a hundred trails in this 625,000 acre national forest, along the

Tennessee-North Carolina State line, accessible within a day's drive by most of the Eastern United States and surrounding the Great Smoky Mountains National Park, one of the most visited parks in the world. This is a fine example of a University Press contributing to local environmental appreciation and conservation. Skelton is a Knoxville, Tennessee attorney. (v4,#3)

Skirbekk, Gunnar, Manuscripts on Rationality (Bergen: Ariadne Forlag, 1992). (in English) Paper, 241 pages. ISBN 82-90477-22-8. Includes: "Technological Expertise and Global Ethics in an Age of Scientization and Ecological Crisis"; "The Beauty and the Beast: Ethical Reflections on the Borderline between Humankind and Beasthood"; "Property and Interdependence: Remarks on the Notion of Ownership in the Borderline between Economy and Ecology" (asking "To what extent is man entitled to treat nature as his private property; what can and cannot be owned?"; and "Ethical Gradualism." The last essay presents arguments in favor of an ethical gradualism between humans and other mammals and between humans and nature. Humans do have a paradigmatically different identity owing to their social nature and to their discursive rationality; nevertheless "there is no sharp borderline between man and higher mammals and some ethical gradualism is therefore called for." Extending this to plants, species, and ecosystems is more problematic. (Norway)

Skirbekk, Gunnar, Eco-Philosophical Manuscripts (Bergen: Ariadne forlag, 1992) (in English). 98 pages. Paper. ISBN 82-90477-27-9. Six essays: "Ecological Crisis and Technological Expertise"; "Science and Ethics"; "A Crisis in the Humanities"; "Political Culture"; "Eco-Crisis and the Welfare State"; "A Pragmatic Notion of Nature." The last is "an essay on the Norwegian way of life, in regard to the rapport between nature and national identity." "Norwegians are not very exciting, except for their relation to nature." Unlike most Europeans, further south, that relation is neither one of domination nor of aesthetic appreciation. Norwegian children grow up with more exposure to nature than most; there is a long history of a close relation between people and nature. "Thus nature, together with history and peasantry, became the foundation of national consciousness. This is a rapport to nature which is not grasped in terms of resources for material exploitation, or as an object for aesthetic contemplation. This is nature as the foundation for self-respect and self-understanding." "The Norwegian ideology of open-air life is ... saturated by caution and piety toward nature by some sort of eco-philosophic reverence for life." "This way of understanding nature, and of living with it, transcends the ethical dimension and points towards the dimension of metaphysics." There is a similar essay in his Rationality and Modernity (forthcoming). (Norway)

Skirbekk, Gunnar, ed., The Notion of Sustainability and its Normative Implications. Oslo: Scandinavian University Press, 1994. 193 pages. Six articles, all in English: Michael Ruse (Philosophy, University of Guelph), "Sustainability"; Jorgen Randers (Economics, Norwegian School of Management, Oslo), "The Quest for a Sustainable SocietyA Global Perspective"; Peter B. Sloep (Biology, Dutch Open University at Heerlen), "The Impact of 'Sustainability' on the Field of Environmental Science"; Kristin Shrader-Frechette (Philosophy, University of South Florida), "Sustainability and Environmental Ethics"; Gunnar Skirbekk, "Ethical Gradualism, beyond Anthropocentrism and Biocentrism?"; Georgios Anagnostopoulos (Philosophy, University of California, San Diego), "Sustainability and Ways of Achieving It." The authors claim to defend a "reasonable radicalism," avoiding the Scylla of soft eco-holism and the Charybdis of shortsighted scientism. Skirbekk is in philosophy at the University of Bergen. A professor of political science at MIT and White House advisor under several administrations, Skolnikoff argues that the most powerful and persistent forces in societal change are science and technology. Included are TV, nuclear weapons, global warming, and the green revolution. This book is the first comprehensive attempt to show the interrelationship of international political systems and science and technology. Based on extensive research and the author's accumulated experience. "... a tour de force" --Ted Greenwood, Sloan Foundation. (v5,#2)

Skorupinski, Barbara, et al., "Consensus Conferences - A Case Study: Publiforum in Switzerland with Special Respect to the Role of Lay Persons and Ethics," Journal of Agricultural and Environmental Ethics 20(2007):37-52. This paper focuses on experiences from a case study dealing with the Swiss type of a consensus conference called "PubliForum" concerning "Genetic Technology and Nutrition" (1999).

Societal and ethical aspects of genetically modified food meanwhile can be seen as prototypes of topics depending on the involvement of the public through a participatory process. The important role of the lay perspective in this field seems to be accepted in practice. Nevertheless, there is still some theoretical controversy about the necessity and democratic legitimacy of participatory processes in general, and especially about those dealing with technological or environmental problems (sustainable development) concerning society. From an ethical point of view, a lot of heterogeneous problems concerning contents and procedures of public participation can be pointed out, not only on the theoretical level but also in practice, e.g., concerning the communication process between laypersons and experts. The intention of our paper is to give hints and to clarify criteria that support the communication process leading to a dialog of autonomous citizens and which especially consider ethical aspects in the field. One important result is that there must be an orientation for all members of a consensus conference having clear rules and knowing their different roles that support transparency, credibility, and fairness of the whole procedure and a "good product": a substantial final document or citizens' report. This paper presents results of the project Ethical Bio-TA Tools as funded by the European Commission, DG Research, under FP5, Quality of Life Programme.

Keywords: autonomy - consensus conferences - GM food - lay persons - publiForum. Skorupinski is in the Unit für Ethics in Biosciences, University of Basel, Switzerland.

Skorupinski, Barbara, "Putting Precaution to Debate - about the Precautionary Principle and Participatory Technology Assessment," Journal of Agricultural and Environmental Ethics 15(no. 1, 2002):87-102. Technology assessment (TA) as an institution was introduced nearly thirty years ago as an instrument to render possible the making of responsible decisions concerning new technological options. Another recent development however has been the introduction of participatory technology assessment (pTA), mainly connected to the growing insight that the evaluation of technological options with respect to their risks and benefits, is not--only--a scientific question. This paper will focus on the questions, to what degree the ideas of technology assessment and the Precautionary Principle are connected and how. Without naming it explicitly, the Precautionary Principle is put to debate in the "TA-arrangement on the cultivation of transgenic herbicide resistant crops," organized by the Science Centre, Berlin. From the perspective of ethical clarification, some unique features concerning the conceptualization of the discursive procedure and reconstruction of the argumentation process in order to come to results have to be analyzed. Finally the performance and results of the pTA-arrangement are reflected in the light of the Precautionary Principle and conclusions are drawn. KEY WORDS: discourse, participatory technology assessment, precautionary principle, risk assessment, transgenic plants. Skorupinski is with the Institute für Social Ethics, Zurich, Switzerland. Slesser, Malcolm, King, Jane, and Crane, David C., The Management of Greed: A Bio-Physical Appraisal of Environmental and Economic Potential. Edinburgh: RUI Publishing Co., 1997. (12, Findhorn Place, Edinburgh Scotland, EH9 2JP) ISBN 1-872579-07-8. 327 pages. £ 12.00. Greed is not entirely bad. It is a motivating force for creativity. It is a spur to endeavor. But where greed becomes an obsession with material acquisition, it can become a cancer. Unconstrained and thoughtless consumption is driving our humanly designed economy and society into an unsustainable state because it is overtaking nature's ability to cope. We humans need to defend nature, not just for her sake, but for ours as well. Nature is infinitely more durable than the human race. Greed is but a fact of the life force. In the management of greed towards positive ends hope can be found. (v.8,#4)

Smail, J. Kenneth, "Beyond Population Stabilization: The Case for Dramatically Reducing Global Human Numbers," Politics and the Life Sciences 16(1997):183-192. There is a growing tension between two apparently irreconcilable trends: (1) demographic projections that world population size will reach 10 to 11 billion by the middle of the next century; and (2) scientific estimates that the Earth's long-term sustainable carrying capacity (at an "adequate to comfortable" standard of living) may not be much greater than 2 to 3 billion. It is past time to develop internationally coordinated sociopolitical initiatives that go beyond slowing the growth or stabilizing global human numbers. After "inescapable realities" that humans must soon confront, and notwithstanding the considerable difficulties involved in establishing "global population optimums," I conclude with several suggestions how best to bring about a very significant reduction in global population over the next two to three centuries (to perhaps 75 percent of the present population). Smail is an anthropologist at Kenyon College, Gambier, Ohio. With commentaries by 16 critics, including Norman Myers, "The Population/Environment Problem: Even more Urgent than Supposed; Timothy F. Flannery, "Australia: Overpopulated or Last Frontier?"; Charles F. Westoff, "Population Growth: Large Problem, Low Visibility; and others.

Small, Bruce H., and Mark W. Fisher, "Measuring Biotechnology Employees Ethical Attitudes towards a Controversial Transgenic Cattle Project: The Ethical Valence Matrix," Journal of Agricultural and Environmental Ethics 18(2005):495-508. Employees of a New Zealand company, AgResearch Ltd., were surveyed regarding a project to create transgenic cattle containing a synthetic copy of the human myelin basic protein gene (hMBP). They were generally: in favor of the project, believed that it should be allowed to proceed to completion, and that it is acceptable to use transgenic cattle to produce medicines for humans. Scales were developed to measure respondents beliefs about the moral outcomes of the project for identified stakeholders in terms of the four principles of common morality (benefit, non-harm, justice, and autonomy). We propose that the Ethical Valence Matrix may be used as a tool to measure ethical attitudes towards controversial issues, Key words attitudes - autonomy - benefit - ethical valence - genetic engineering - harm - justice - principles - research - stakeholders. The authors are in the Social Research Unit, Ruakura Research Centre, AgResearch Ltd, Hamilton, New Zealand. (JAEE)

Smeloff, Ed, and Asmus, Peter. Reinventing Electric Utilities. Washington, D.C.: Island Press, 1996. 165 pages. \$34.95 cloth, \$16.95 paper. Through an in-depth case study of the Sacramento Municipal Utility District, a once troubled utility that is now widely regarded as a model for energy efficiency and renewable energy development, the authors explore the changes that have occurred in the utility industry, and the implications of those changes for the future. (v7, #3)

Smil, Vaclav, The Bad Earth: Environmental Degradation in China. Armonk, NY: M. E. Sharpe, Inc. and London: ZED Press, 1984. 245 pages. Extensive account of serious environmental degradation and highly critical of the Maoist government and massive, bumbling Chinese bureaucracy. Deforestation and resulting erosion and flooding is China's most serious environmental problem. Much of this results from Marxist idealism about growing grain in unsuitable areas. The land use mistakes, when coupled with population, growth, have China on a disaster course. The silting of the Huang (Yellow) River is one of the most intractable environmental problems on Earth. The most fundamental problem is not population size, or relative poverty, or political instability; it is a staggering mistreatment of the environment, which will prove the most serious check on China's reach toward prosperity. Smil is a geographer at the University of Manitoba. (China)

Smil, Vaclav, Global Ecology: Environmental Change and Social Flexibility. New York: Routledge, 1993. 256 pages. Paper, £ 13.99. The magnitude and rapidity of global environmental change threatens the perpetuation of life on Earth, yet we avoid the underlying challenge of a rapidly deteriorating ecological system. The breadth and complexity of responses demanded require a flexible social response. Smil is at the University of Manitoba. (v5,#1)

Smil, Vaclav, Feeding the World: A Challenge for the Twenty-First Century. Cambridge, MA: The MIT Press, 2000. Neither the catastrophic view that widespread starvation is imminent, nor the cornucopian view that welcomes more population confident that human inventiveness can feed them. Rather, if we increase farming efficiency, reduce waste, and transform our diets, prospects are not as bright as we would like, but the outlook is not disheartening. (v.12,#4)

Smil, Vaclav, Enriching the Earth: Fritz Haber, Carl Bosch, and the Transformation of World Food Production. Cambridge, MA: MIT Press, 2001. The industrial synthesis of ammonia from atmospheric nitrogen and hydrogen, making possible large amounts of nitrogen rich fertilizer, has been of greater fundamental significance to the modern world than the invention of the airplane, nuclear energy, space flight, or television. The expansion of the world's population from 1.6 billion in 1900 to today's six billion would not have been possible without the synthesis of ammonia and the resulting fertilizer. One is left wondering whether any comparable technologies might be forthcoming. (v.11,#4)

Smil, Vaclav, China's Environmental Crisis: An Inquiry into the Limits of National Development. London and Armonk, NY: M. E. Sharpe, 1993. ISBN 0-87332-819-0 cloth. 1-56324-041-6 paper. A fine analysis, and a good reality check for those who think that environmental ethics or environmental legislation is a priority in China. By a long-term China scholar, at the University of Manitoba.

Smil, Vaclav, "China Shoulders the Cost of Environmental Change" Environment 39 (no. 6, 1997):6-9, 33-37. As demographic growth and industrial expansion continue to transform the world's most populous nation, the price China will pay for degrading its air, water, and land grows. Although complete data are difficult to obtain, there can be no doubt that recent environmental changes in China already carry economic costs roughly an order of magnitude higher than the country's annual spending on environmental protection. Even if the government tripled or quadrupled its outlays, they could easily meet the strictest benefit-cost criteria. Smil teaches geography at the University of Manitoba, Winnipeg. Smith, Bruce D. "The Ultimate Ecosystem Engineers." *Science* Vol. 315, no. 5820 (30 March 2007): 1797-98. "Ecosystems engineers" has become a buzzword for animals that behave in ways that result in changes in their surrounding environment, such as beavers and their ponds. Here humans are called the ultimate ecosystem engineers, due to their management of wild plants sowing, burning, weeding, irrigation, transplanting, mulching, and also their use of dogs. But the word "ultimate" is a considerable overstatement, since humans often modified landscapes only locally, often failed, often did not realize the results of that they were doing, and often had to abandon landscapes they had modified and degraded. Also, it is difficult for landscapes to recover from the remaining effects of human modification in the remote past.

The western Sahara, long in the midst of a drought, is as green as it has been for sixty years, and this has brought locust hordes, the worst infestation since the 1980's. Locusts can ride fifty miles a day in the winds, in hordes that can be seen from satellites. They devastate crops. A serious part of the problem is a contested border, 20-30 miles wide, long claimed by both Morocco and Algeria, and which neither side wishes to enter to treat for fear of hostilities. This has become an unintended breeding ground for locusts. (v. 15, # 3)

Smith, Graham Martin, Pluralism, Deliberative Democracy and Environmental Values, 1997, University of Southampton (United Kingdom), Ph.D. thesis in political science. 532 pages. How contemporary democratic decision making processes might more adequately attend to environmental values, connecting environmental politics and ethics. Humans value the nonhuman world in diverse ways. Value pluralism challenges moral philosophy and environmental ethics where the aim is to develop a monistic ethical theory. Decision making techniques such as cost-benefit analysis are insensitive to such value pluralism and misrepresent the values we associate with the nonhuman world. Liberal theory and liberal representative institutions fail to attend to environmental value pluralism. Two potential models of deliberative institutions are investigated--citizen panels and mediation--which might increase the ecological quality of political decisions. (v.10,#1)

Smith, Kimberly K., "Natural Subjects: Nature and Political Community," Environmental Values 15(2006):343-353. Environmental political theory poses new challenges to our received political concepts and values. Increasingly, we are reconceptualising nature as a subject rather than solely an object of politics. On one front, we are being challenged to think of natural entities as subjects of justice - as bearers of rights or interests that the political system should accommodate. On a second front, we are being challenged to see nature as a subject of power, constructed and ordered through scientific and political practice. These reconceptualisations have significant implications for our political practices and institutions. (EV)

Smith, Kimberly K. "What is Africa to Me? Wilderness in Black Thought, 1860–1930." Environmental Ethics 27 (2005):279-297. The concept of wilderness found in the black American intellectual tradition poses a provocative alternative to the preservationist concept. For black writers, the wilderness is not radically separate from human society but has an important historical and social dimension. Nor is it merely a feature of the external landscape; there is also a wilderness within, a vital energy that derives from and connects one to the external wilderness. Wilderness is the origin and foundation of culture; preserving it means preserving not merely the physical landscape but our collective memory of it. But black writers also highlight the racial essentialism that infuses both their own and traditional American concepts of the wild, giving us greater insight into why the wilderness celebrated by preservationists can be a problematic value for racial minorities. (EE)

Smith, Kimberly K. *African American Environmental Thought: Foundations*. Lawrence: University of Kansas Press, 2007. Beginning with environmental critiques of slave agriculture in the early nineteenth century and evolving through critical engagements with scientific racism, artistic primitivism, pragmatism, and twentieth-century urban reform, Smith highlights the continuity of twentieth-century black politics with earlier efforts by slaves and freedmen to possess the land. Her analysis focuses on the importance of freedom in humans' relationship with nature. According to black theorists, the denial of freedom can distort one's relationship to the natural world, impairing stewardship and alienating one from the land. Smith links the early conservation movement to black history, black agrarianism, and scientific racism. She offers a normative environmental theory grounded in pragmatism and aimed at identifying the social conditions for environmental virtue.

Smith, Kimberly K. "Animals and the Social Contract: A Reply to Nussbaum." *Environmental Ethics* 30(2008)195-207. In *The Frontiers of Justice*, Martha Nussbaum argues that social contract theory cannot accommodate political duties to animals because it requires the parties to the contract to enjoy rough physical and mental equality. Her interpretation of the social contract tradition is unpersuasive; social contract theory requires only that the parties be equally free and deserving of moral consideration. Moreover, social contract theory is superior to her capabilities approach in that it allows us to limit the scope of the community of justice to animals we are capable of recognizing as subjects of justice and with whom we have a political relationship. (EE)

Smith, Kimberly. "Black Agrarianism and the Foundations of Black Environmental Thought." *Environmental Ethics* 26(2004):267-286. Beginning with the nineteenth-century critiques of slave agriculture, African American writers have been centrally concerned with their relationship to the American landscape. Drawing on and responding to the dominant ideology of democratic agrarianism, nineteenth-century black writers developed an agrarian critique of slavery and racial oppression. This black agrarianism focuses on property rights, the status of labor, and the exploitation of workers, exploring how racial oppression can prevent a community from establishing a responsible relationship to the land. Black agrarianism serves as an important starting point for understanding black environmental thought as it developed in the twentieth century, and for illuminating the connections between social justice and environmental stewardship. Smith, Mick, "The State of Nature: The Political Philosophy of Primitivism and the Culture of Contamination," Environmental Values 11(2002):407-425. The "state of nature" could be understood in two senses; both in terms of its nature's current (sorry) condition and of that unmediated and pre-contractual relation between humanity and the environment posited by political philosophers like Locke and Rousseau and now championed by anarcho-primitivism. Primitivism is easily dismissed as an extreme, naive and impractical form of radical environmentalism but its emergence signifies contemporary disaffection with the ideology of "progress" so central to modernity and capitalism. This paper offers an ethico-political interpretation of primitivism's critical relation to modernity in terms of the dialectic between amorality (innocence) and immorality (guilt) within what is characterized as modernity's "culture of contamination". Smith, Mick, "Citizens, Denizens and the Res Publica: Environmental Ethics, Structures of Feeling and Political Expression," Environmental Values 14(2005): 145-162. Environmental ethics should be understood as a radical project that challenges the limits of contemporary ethical and political expression, a limit historically defined by the concept of the citizen. This dominant model of public being, frequently justified in terms of a formal or procedural rationality, facilitates an exclusionary ethos that fails to properly represent our concerns for the non-human world. It tends to regard emotionally mediated concerns for others as a source of irrational and subjective distortions in an otherwise rationally ordered ethico-political community. In doing so it underestimates the important role played by "structures of feeling," those culturally variable patterns of emotionally mediated responses, that provide the (shifting) grounds for all ethical experience, motivation, communication and interpretation. An alternative model of political expression more suitable to an environmental ethic, the denizen, is suggested. Smith is in environmental studies, Queen's University, Kingston, Ontario. (EV)

Smith, Mick. "Cheney and the Myth of Postmodernism." Environmental Ethics 15(1993):3-17. I draw critical parallels between Jim Cheney's work and various aspects of modernism, which he ignores or misrepresents. I argue, first, that Cheney's history of ideas is appallingly crude. He amalgamates all past Western philosophical traditions, irrespective of their disparate backgrounds and complex interrelationships, under the single heading, modern. Then he posits a radical epistemological break between a deluded modernism--characterized as foundationalist, essentialist, colonizing, and totalizing--and a contextual postmodernism. He seems unaware both of the complex genealogy of postmodernism and of those aspects of modern traditions that prefigure his own thesis. Second, Cheney's account of primitive peoples is both ethnocentric (though positively so) and inaccurate. Third, Cheney reduces context or place to a concept of bioregionality. In this way, he reinstates a privileged foundationalism which, by his own definitions, makes his philosophy modernist. I develop these criticisms in order to suggest a less restricted contextual approach to environmental values. Smith is in the philosophy department, University of Stirling, Scotland. (EE)

Smith, Mick. "Terra Nova: Nature and Culture." Environmental Politics 7(no.1, Spring 1998):237-240. A review essay of the contents of the journal Terra Nova, edited by David Rothenberg. Terra Nova claims to be the journal to dissolve the "polarity" between nature and culture. "Terra Nova could be seen as expression of the need for a green poetics, a psycho-social alchemy, which might escape the all too narrow confines of normal academic journals. It tries to be 'extra' rather than 'inter' disciplinary and for that reason often seems extra-ordinary. ... Not long ago a journal like Environmental Ethics was regarded by serious (that is to say 'staid') philosophers as a wacky irrelevance. Today not least due to the efforts of the editors of Environmental Ethics, environmental issues have begun to enter the philosophical mainstream and the journal's primogeniture carries with it a certain academic cachet." The mantle of the marginal has passed to Terra Nova, the only journal that can put Wordsworth together with Wittgenstein. Smith is at the University of Abertay, Dundee, Scotland. (v10,#4)

Smith, Mick. "To Speak of Trees: Social Constructivism, Environmental Values, and the Future of Deep Ecology." Environmental Ethics 21(1999):359-376. The power and the promise of deep ecology is seen, by its supporters and detractors alike, to lie in its claims to speak on behalf of a natural world threatened by human excesses. Yet, to speak of trees as trees or nature as something worthy of respect in itself has appeared increasingly difficult in the light of social constructivist accounts of "nature." Deep ecology has been loath to take constructivism's insights seriously, retreating into forms of biological objectivism and reductionism. Yet, deep ecology actually has much in common with, and much to gain from, some varieties of constructivism and can add a new dimension to constructivism's own critique of current

ideologies. (EE)

Smith, Mick. "Environmental Anamnesis: Walter Benjamin and the Ethics of Extinction." Environmental Ethics 23(2001):359-376. Environmentalists often recount tales of recent extinctions in the form of an allegory of human moral failings. But such allegories install an instrumental relation to the past's inhabitants, using them to carry moralistic messages. Taking the passenger pigeon as a case in point, I argue for a different, ethical relation to the past's inhabitants that conserves something of the wonder and "strangeness of the Other." What Walter Benjamin refers to as the "redemptive moment" sparks a recognition of the Other that allows us to engage in heartfelt mourning for them, rather than falling into the repetitive self-absorption characteristic of Freudian melancholy. This redemptive moment changes forever our relations to the world around us. (EE)

Smith, Mick. "Avalanches and Snowballs: A Reply to Arne Naess." Environmental Ethics 23(2001):223-224. (EE)

Smith, Mick. "Worldly (In)Difference and Ecological Ethics: Iris Murdoch and Emmanuel Levinas." Environmental Ethics 29(2007):23-41. The natural world's myriad differences from human beings, and its apparent indifference to human purposes and ends, are often regarded as problems an environmental ethics must overcome. Perhaps, though, ecological ethics might instead be re-envisioned as a form of other-directed concern that responds to just this situation. That is, the recognition of worldly (in)difference might actually be regarded as a precondition for, and opening on, any contemporary ethics, whether human or ecological. What is more, the task of ethics might be regarded as one of conserving (at least some) such differences. The work of Iris Murdoch and the "difference ethics" of Emmanuel Levinas seem to offer possible ways to express such understandings. However, their ecological potential and theoretical limits, especially in terms of their metaphysical presuppositions, remain relatively under-explored. A closer examination of their work is presented in order to illustrate some of the possibilities and difficulties facing an ecological form of difference ethics. (EE)

Smith, Mick. "Environmental Antinomianism: The Moral World Turned Upside Down?" Ethics and the Environment 5(2000):125-139. ABSTRACT: In rejecting the ethical authority of those social institutions that attempt to define and impose norms of belief and behavior, radical environmentalism has many parallels with past antinomian protests. It is characterized by a 'hermeneutics of suspicion' directed towards the establishment in all its forms and extending to all its attempts to 'lay down the law.' Those nomothetic models which represent environmentalists as (a) seeking to extend current legal/bureaucratic frameworks to 'nature', or (b) drawing moral conclusions from 'natural laws' are guilty of ignoring radical environmentalism's antinomian ethos. (E&E)

Smith, Mick. "Against the Enclosure of the Ethical Commons: Radical Environmentalism as an 'Ethics of Place.'" Environmental Ethics 19(1997):339-353. Inspired by recent anti-roads protests in Britain, I attempt to articulate a radical environmental ethos and, at the same time, to produce a cogent moral analysis of the dialectic between environmental destruction and protection. In this analysis, voiced in terms of a spatial metaphoric, an "ethics of place," I seek to subvert the hegemony of modernity's formal systematization and codification of values while still conserving something of modernity's critical heritage: to reconstitute ethics in order to counter the current enclosure of the moral field within economic and legal bureaucratic frameworks and institutions. Smith is in sociology, University of Abertay Dundee, Scotland. (EE)

Smith, Mick. "Lost for Words? Gadamer and Benjamin on the Nature of Language and the 'Language' of Nature," Environmental Values 10(2001):59-75. Language is commonly regarded as an exclusively human attribute and the possession of the word (logos) has long served to demarcate culture from nature. This is often taken to imply that nature is incapable of meaningful expression, that any meaning it

acquires is merely bestowed upon it by humanity. This anthropic logocentrism seriously undermines those forms of "environmental advocacy" which claim to find and speak of the meaning and value of nature per se. However, shorn of their own anthropocentric presuppositions, the expressivist hermeneutics of Hans-Georg Gadamer and Walter Benjamin might offer an alternative understanding of the nature of language and the language of nature. Keywords: Expressionism, Gadamer, hermeneutics, nature, language. Mick Smith is at the University of Abertay, Dundee, Scotland. (EV)

Smith, Mick. "Environmental Risks and Ethical Responsibilities: Arendt, Beck, and the Politics of Acting into Nature." Environmental Ethics 28(2006):227-246. The question of environmental responsibility is addressed through comparisons between Hannah Arendt's and Ulrich Beck's accounts of the emergent and globally threatening risks associated with acting into nature. Both theorists have been extraordinarily influential in their respective fields but their insights, pointing toward the politicization of nature through human intervention, are rarely brought into conjunction. Important differences stem from Beck's treatment of risks as systemic and unavoidable side effects of late modernity. Arendt, however, retains a more restrictive anthropogenic view of political action which, while recognizing its unpredictable consequences for human (and nonhuman) others, includes a direct link between individually initiated acts and the taking of ethical responsibility. This latter account best explains the ethical motivations behind much environmental activism. (EE)

Eco-Ethics and the Catholic Magisterium. "An ethic of respect, if not of widespread 'rights,' seems to be arising from a conviction that some sort of 'intrinsic value' can be posited for all sorts of lifeforms and their support systems. The basis for claiming such 'intrinsic value' may be a religious one--a sense that creation, in all its diversity, is revelatory, bearing a 'trace of the Trinity' (St. Thomas Aquinas) or God's 'insignia,' the 'marks of his glory' (John Calvin). Or it may be an intuition of a kind of 'spirit' or sacrality present in living creatures beyond the human. In a more philosophical vein, 'intrinsic value' can be

claimed on the basis of the directionality, the impetus to survival and continuation and proliferation which is observed among a wide array of living beings. Perception of 'kinship' among the diversity of beings and of 'interrelatedness' implicit in ecosystemic processes lend support to more evolutionary and cosmogenetic theories of 'intrinsic value' (p. 98). Smith teaches systematic theology at SS. Cyril and Methodius Seminary in Orchard Lake, Michigan. (v9,#2)

Smith, Steven G., "Sympathy, Scruple, and Piety: The Moral and Religious Valuation of Nonhumans," *Journal of Religious Ethics* 21 (no. 2, 1993):319-342. Our moral valuation of nonhuman and human beings alike may arise in sympathy, the realization in feeling of a significant commonality between self and others; in scrupulous observance of policy, the affirmation in practical consistency of a system of relations with others; and in piety, the attitude of boundless appreciation and absolute scruple with respect to objects as sacred that is, as valued for the sake of adequate valuation of the holy. Differences between the moral status of humans and that of nonhumans are to be explained not by any single criterion such as the capacity to suffer or to make contracts, but rather by finding the relative position of humans and nonhumans on continua of feelable commonality, policy considerateness, and sacredness. Investigation of these differences must take into account the way basic religious apprehensions (or the absence thereof) organize these frames of reference. Smith is in religious studies at Millsaps College, Jackson, MS. (v5,#4)

Smith, Tony. "The Case Against Free Market Environmentalism." Journal of Agricultural and Environmental Ethics 8(1995):126-144. Free market environmentalists believe that the extension of private property rights and market transactions is sufficient to address environmental difficulties. But there is no invisible hand operating in markets that ensures that environmentally sound practices will be employed just because property rights are in private hands. Also, liability laws and the court systems cannot be relied upon to force polluters to internalize the social costs of pollution. Third, market prices do not provide an "objective measure" of environmental matters. Finally, there is a right to a livable environment that justifies regulations protecting the public from unreasonable environmental risks. (JAEE)

Smith, Tony. "Biotechnology and Global Justice," Journal of Agricultural and Environmental Ethics 11(1999):219-242. I explore two questions regarding agricultural biotechnology, one descriptive and one evaluative. What role is agricultural biotechnology likely to play in globalization? And is the diffusion of agricultural biotech likely to move us closer to a just global order? Before we can consider such questions, however, we must come to an understanding and assessment of globalization. Unfortunately, this too is an immensely complicated and controversial topic. In order to make things a bit more manageable I shall drastically oversimplify matters, restricting the debate to just two competing accounts of globalization. The first of these accounts, termed "neoliberalism," is familiar, consisting of a set of ideas circulating constantly in the business press, trade publications, the popular media, and mainstream

academic discourse. Its main conclusion in the present context is reassuring: social mechanisms are in place to ensure that global justice is more or less automatically furthered by the diffusion of agricultural biotechnology. The second perspective, which I shall term the "heterodox" or "critical" perspective, is in contrast relatively unfamiliar. It leads to the disturbing conclusion that under present circumstances the rational development of biotechnology may contribute to results that are irrational from a social and ethical perspective. (JAEE)

Smithsonian, April 1990, vol. 21, no. 1, is a special issue devoted to the environment. Articles on conservation history, current successes in conversation, clean water, endangered raptors, nature artists, alternative agriculture, rails-to-trails, garbage, trees in cities, urban wildlife, the glare of wasted light on the night sky, and radical environmentalists (principally Dave Foreman and Earth First, but also citing George Sessions and Bill Devall). (v1,#2)

Smolin, Lee, The Life of the Cosmos. New York: Oxford University Press, 1997. Claims that the universe, cosmology, is to be understood more as a living system than a mechanism. The world is a network of self-organizing relations. Natural selection needs to be extended beyond biology to the universe as a whole. (Such natural selection is the selection of the stablest systems. Smolin does not seem to realize that "the stablest survive" is even more subject to the charge of being a tautology than "the fittest survive." Also, concepts analogous to genetic information transfer and cumulation, over which natural selection can operate, are difficult to extrapolate to astronomical systems.)

Smolková, Eva, "K Problému Vztahu Hodnotenia a Poznania v Environmentálnom-myslení (Towards the Relationship between Evaluation and Knowledge in Environmental Thinking)," Filozofia 55(no. 7, 2000):545-556. In Czech. This paper examines the importance of the relationship between evaluation and knowledge in environmental thinking. It focuses on the impact of scientific knowledge on value structures, as well as on the process of creating acceptance of values, especially those having existential meaning and ontological status. The author sheds light also on the separation of facts from values and on the distinction between knowledge and evaluation as taking place in modern culture. She analyses particularly the impact of these processes on creating and accepting values in environmental issues. Smolková is in philosophy, Slovak Academy of Science, Bratislava, Slovakia.

Smolková, Eva, "K otázke limitov environmentálnej etiky (Limits of Environmental Ethics)" Filozofia 54(no. 8, 1999):569-579. In Czech. Why some problems in environmental ethics remain unresolved. Limits of our ethical thinking as well as the possibility of a new ethics. Ways of making anthropocentric and environmental values equal. Presuppositions of the practical acceptance of environmental values. The possibility of an applied ethics offered by the concept of sustainable development. Smolková is in philosophy, Slovak Academy of Science, Bratislava, Slovakia.

Sneath, David, "State Policy and Pasture Degradation in Inner Asia," Science 281(1998):1147-1148. Much of inner Asia is rolling grassland, used since ancient times for raising livestock. Over 6% of the world's grassland is here. Compared to massive degradation (50% - 75%) of arable land in northern China, Inner Mongolia, and southern Siberia, there is relatively little pasture degradation in the independent state of Mongolia (about 9%). These dramatic differences result from very different state policies. Sneath is in social anthropology, Cambridge University. (v.9,#3)

Snell, Marilyn Berlin. "Bulldozers and Blasphemy: In Latin America, Catholics Are Standing Up to those who Covet their Gold and Timber." *Sierra* Vol. 92 (October 2007): 36-43, 63, 76. Latin American rural peoples and villagers are being displaced by large mines, often operated by Canadian firms and sometimes by U.S. firms. Latin American governments may be as interested in the tax and other income from the mines as they are the welfare of local peoples. But there is a "liberation ecology" movement, similar to the liberation theology movement. A growing number of Catholic clergy throughout Latin America have come to see protection of the land and water as God's work, their duty to the region's 500 million Catholics. They are often quite effective in organizing protests, so much so that one priest in Honduras requires bodyguards.

Snoeyenbos, Milton H. "A Critique of Ehrenfeld's Views on Humanism and the Environment." Environmental Ethics 3(1981):231-35. David Ehrenfeld argues that humanism emphasizes reason at the expense of emotion, and that its narrow focus on the use of reason to serve human interests leads to a dichotomy between man and nature in which ecological factors are subordinated to the satisfaction of human wants. In response, I argue that: (1) humanists stress employment of reflective reason and reason's interrelations with other aspects of the human personality, (2) humanism's typical commitment to naturalism locates man as part of nature and does not entail an exclusive focus on human interests, and (3) humanism's commitment to the legitimate sphere of human interests does not entail indifference to nonhuman nature, for a healthy environment is necessary for the long-term satisfaction of human

interests. Snoeyenbos is in the philosophy department, Georgia State University, Atlanta, GA. (EE)

Sobel, David, *Beyond Ecophobia: Reclaiming the Heart in Nature Education*. Great Barrington, MA: Orion Society and Myrin Institute, 1996. In a Nature Literacy Series. School children learn a debilitating fear for the future of the planet (ecophobia) from what they hear in the media. Meanwhile they learn little about the joys to be had in the forests and meadows just outside the classroom door. The remedy for environmental despair is as close as the front door. Leave no child inside. Sobel codirects Center for Place-Based Education at the Antioch New England Institute.

Sober, Elliott, and Wilson, David Sloan, Unto Others: The Evolution and Psychology of Unselfish Behavior. Cambridge, MA: Harvard University Press, 1998. A pioneering and highly readable analysis of the evolution and psychology of cooperation, understood from an evolutionary perspective. Part I of the book argues that group selection is important in evolution, and has been unjustifiably dismissed by evolutionary theorists, blinded by their insistence on selection at the individual level. In group selection, animals can evolve behaviors that are for the good of the group, though to the detriment of the individual (without any reference to intentions and without moral import). Part II argues that group selection in humans can lead to genuinely altruistic behavior, and examines the psychological evidence for such behavior. People (and perhaps other species) evolved the capacity to care for others as a goal in itself. Sober is in philosophy at the University of Wisconsin, Madison, and a well-known philosopher of biology. Wilson is in biology, Binghamton University, State University of New York. (v.10,#1)

Social Learning Group, Learning to Manage Global Environmental Risks. Volume 1: A Comparative History of Social Responses to Climate Change, Ozone Depletion, and Acid Rain. Volume 2: A Functional Analysis of Social Responses to Climate Change, Ozone Depletion, and Acid Rain. Cambridge, MA: The MIT Press, 2001. A team of 37 scholars from ten different countries argues that we need to develop a long-term comparative perspective on the evolution of social responses to global environmental risks, and especially the role of learning in that evolution. Decision-making on transnational environmental issues can and ought improve through reasoned dialogue and the increasing inter-dependency between countries. It is legitimate to frame engagement with global environmental

problems in terms of risk management rather than in terms of global governance or environmental politics.

Society and Natural Resources is an international journal for the conservation, preservation, and management of natural resources. Some forthcoming article titles: Robert D. Bullard and Beverly H. Wright, "The Quest for Environmental Equity: Mobilizing the African-American Community for Social Change"; Keith Hollinshead, "The Ethics of Ennoblement: A Review of Leopold on Leisure and of Callicott on Leopold"; John Wargo, "Science, Values, Control, and Equity: Foundations of Multiple Use Resource Policy"; Bill Devall, "Deep Ecology and Radical Environmentalism." Vol. 4, no. 1 is a special issue on "Women and Natural Resources in Developing Countries," Nancy Lee Peluso, guest editor.

Society and Natural Resources, Vol. 15, No. 3, 2002 is a theme issue on environmental sociology, with particular focus on the sociology of natural resources, wondering about the differences between rural sociology, natural resource sociology, and environmental sociology. (v.13,#2)

Soifer, Eldon, ed., Ethical Issues: Perspectives for Canadians. Peterborough, Ontario: Broadview Press, 1992. An anthology with a Canadian focus: the distribution of scarce resources, the animal rights debate, and the foundations of environmental law and social policy. The standard positions and counter-positions of Garret Hardin, Peter Singer, Joel Feinberg, and R. G. Frey appear on these topics, but other angles are presented as well. Roger Crispin argues that a utilitarian ethic favors a "humane" exploitation of animals over vegetarianism, provided that the animals are well-cared-for before the slaughter. J. Baker documents the anti-fur lobby and its impacts, which he argues are harmful to aboriginal cultures and the protection of natural ecosystems. Most interesting are the approaches to environmental law and policy. The Canadian Law Reform Commission rejects both deep ecology and property law in favor of defending the environmental commons for reasons of human welfare, with a priority of health over amenity values. Paul Emonds reflects on the legal and policy implications of a shift in world view from dominating nature to cooperation. Charles Taylor discusses both the necessity and extreme difficulty of making the shift to a steady state economy for a society in which issues of self-identity, welfare, and justice are resolved on the premise of growth. (Thanks to Peter Miller, University of Winnipeg.)

Sokstad, Erik, "Engineered Fish: Friend or Foe of the Environment?" Science 297(13 September 2002):1797-1799. With the world's fish consumption rising, transgenic fish might alleviate pressure on wild stocks. But researchers worry that genetically engineered fish, if they escaped, could wreak ecological havoc.

Solomon, Rabbi David, et al., Eichut Hasviva ba Yahadut (Environmental Quality in Judaism). Tel-Aviv: Bar-Ilan University Press, 1990. In Hebrew. Perhaps the best of many academic publications in Hebrew about the environment in the Bible and in Talmudic literature. With many quotations. (v5,#1)

Solomon, Steven, The Confidence Game: How Unelected Central Bankers Are Governing the Changed World Economy. New York: Simon and Schuster, 1995. 606 pages. From behind the walls of the U.S.

Federal Reserve Bank, the German Bundesbank, the Bank of Japan, the Bank of England, and the enigmatic Bank for International Settlements in Switzerland, the world economy and politics have been transformed by the eruption of high-speed, volatile global money flows, a global monetary system that has often teetered on the brink of catastrophe. Solomon was formerly with Forbes magazine. (v.9,#4)

Solow, Andrew, Stephen Polasky, and James Broadus, "On the Measurement of Biological Diversity," Journal of Environmental Economics and Management 14(1993):60-68. To ensure an efficient allocation of conservation resources, we need to define fairly precisely what biological diversity we hope to conserve, but that requires better measures of biological diversity. The authors present a general, and rather mathematical, approach to optimizing the conservation of qualities that, like species, change only with extinction. We have no good models for large scale problems, but this one may be useful for small scale problems, like the selection of conservation sites. The model measures diversity but does not indicate how to value it. Their model is applied to crane species. Solow and Broadus are at Woods Hole Oceanographic Institution, Polasky is in economics at Boston College. (v5,#1)

Soma, Katrine, "Natura economica in Environmental Valuation," Environmental Values 15(2006): 31-50. Cost-benefit analysis is widely acknowledged to be an appropriate tool for providing advice to policy makers on the optimal use and management of natural resources. However, a great deal of research has indicated that the assumptions made in cost-benefit analysis concerning the natural environment diverge from real world observations. In this paper I discuss these observed divergences. To do so, I introduce the concept of Natura economica. Natura economica is the environment as it is understood in economic analysis in general, and cost-benefit analysis in particular, namely as a bundle of commodities with potential market value. I argue that if this understanding of nature and its value is very different from what is generally observed, it reduces the value of the resulting policy recommendations. I then suggest four questions that policy makers should ask when they evaluate their choice of appraisal methods. If the answer is 'yes' to all of them, then cost-benefit analysis can provide valid information. However, if the answer to any of these questions is 'no', other methods, such as multicriteria analysis and participatory processes, should be considered in order to arrive at better-founded policy recommendations. Protected areas in Africa suffer from a lack of funds and are often surrounded by extremely poor communities. Many conservation staff assume that business and profitability are unethical and will destroy natural resources. But there are ways to integrate entrepreneurial thinking with conservation principles and ethics. This is illustrated from a

workshop that assisted conservationists at the South African Wildlife College (near Kruger National Park). The group involved identified many innovative ways in which they could derive sustainable income from natural resources while simultaneously achieving their conservation objectives. Sonnekus is in education, University of South Africa, Pretoria. Breytenbach is with the South African Integrated Development Initiative, Cramerview, R.S.A. (v.12,#3)

Soper, Kate, What Is Nature? Culture, Politics and the Non-Human. Cambridge, MA: Blackwells's, 1995. The politics of nature; the demarcations drawn through the concept and its currently contested status. An encounter between "nature-endorsing" and "nature-skeptical" perspectives, the one associated with the ecological advocacy of nature and the request to respect and conserve it, the other with a post-structuralist focus on the "cultural construction" of nature. Soper hopes to pose the question of nature anew in ways that allow for a resolution of these contrary impulses. Postmodernists must accept a form of realism about nature, admitting that it is not completely a social construct. Environmentalists must attend to the oppressive uses to which the ideas of nature, the natural, wilderness, among others, continue to be put. Soper holds an anthropocentric view of our obligations to nature. Soper is in philosophy at the University of North London. (v8,#1)

Soulé, Michael E., "Conservation: Tactics for a Constant Crisis," Science, August 16, 1991, The fundamental factors that erode biological diversity are: population growth, poverty, misperception, anthropocentrism, cultural transitions, economics, and policy implementation failure. "Many conservationists argue that current cultural values are antithetical to effective conservation policies, and that a new ethic or a revolutionary change in human consciousness is necessary, before significant progress is made" (p. 746). (v2,#3)

Soulé, Michael E. and Gary Lease, eds. Reinventing Nature? Responses to Postmodern Deconstruction. Island Press, 1995. 186 pages. The rhetorical storm over "nature," and the practical consequences. "A wave of relativistic anthropocentrism originating in the humanities and social sciences with clear implications for a wide range of biodiversity conservation policies and actions." An interdisciplinary investigation of how perceptions and conceptions of nature affect both the individual experience and society's management of nature.

Chapter One: "Nature Under Fire" by Gary Lease. The boundary between the world and human beings is under fire. On the one hand nature is personified; on the other hand the idea that nature needs protection from humankind's onslaught begs the definition of the boundary and turns our attention to contesting constructions of nature and to competition among human groups for access to resources and power.

Chapter Two: "Virtually Hunting Reality in the Forests of Simulacra" by Paul Shephard. The postmodern constructionist view is that all texts, reports, narratives are but descriptions--focused chatter about an unknowable external world, psychobabble, webs of words that serve as ammunition in struggles over who dominates whom.

Chapter Three: "The Nature of Reality and the Reality of Nature" by Albert Borgmann. The substitute for the dualism of natural and artificial is a new continuum: reality--hyperreality. And even if nature (reality) is to some extent a human invention, it still can be eloquent and inspiring and still can invigorate the notion of excellence.

Chapter Four: "Searching for Common Ground" by N. Katherine Hayles. The notions of interactivity and positionality enliven the stakes in contesting for the integrity of the environment. Those in power, therefore, should consider marginal points of view, including those of other species.

Chapter Five: "Nature and the Disorder of History" by Donald Worster. A less extreme interpretation of contemporary history and ecology might stress two principles: one is social and

biological interdependence; the other is successful adaptation to situation and place by human groups and species.

Chapter Six: "Cultural Parallax in Viewing North American Habitats" by Gary Paul Nabhan. The polarized debate about aboriginal impacts obscures the complexity and diversity of old cultures in North America and ignores cultural adaptation and change.

Chapter Seven: "Concepts of Nature East and West" by Stephen R. Kellert. Even though nature evokes common emotional and intellectual structures in humans (evidence for a shared understanding), cultures are heterogeneous in how they value nature.

Chapter Eight: "Resolute Biocentrism: The Dilemma of Wilderness in National Parks" by David M. Graber. National parks (and wilderness in general) are by default the sites where the values of solitude, wildness, and otherness reside. Yet the baseline criteria for original, natural, or pristine states still elude managers.

Chapter Nine: "The Social Siege of Nature" by Michael E. Soulé. Humanity entertains manifold representations of living nature--from quite pagan/spiritual views to the more utilitarian (Judeo-Christian) and scientific conceptions displayed on television documentaries.

Soulé is in environmental studies at the University of California, Santa Cruz; Lease is dean of humanities there. (v6,#1)

Southern Forest Sustainability, study released. A draft of the Southern Forest Resource Assessment (SFRA) was released on November 26 by the U.S. Forest Service. The SFRA, a two-year study of the health and future prospects of forests in the southern U.S., can be viewed at www.srs.fs.fed.us/sustain. The study was undertaken by federal agencies at the urging of the Dogwood Alliance and other organizations (www.dogwoodalliance.org.) Forest protection groups have been generally unsatisfied with both the draft and the "spin" given it by the Forest Service and the timber industry. Most media reports stated that the report listed urban development as the leading threat to the future of the region's forests,

while downplaying the impacts of industrial forestry, which often relies on extensive clearcuts and conversion of native forests to mono-culture pine plantations. The actual text, a long and detailed document, gives a more complex picture. While urban development is certainly a leading cause of forest loss in many areas, projections showing a dramatic rise in consumption of paper and other wood products on the global and national level are also troubling. Pulp and paper production is currently the leading use for wood harvested from the south, and a major use of forests elsewhere. ISEE members and others in the academic community and university systems, all major consumers of paper, have an important role to play by getting their institutions to increase their use of post-consumer recycled and/or alternative fiber papers. While many universities have recycling programs, most have not focused on the other side of the equation, which is the kind of paper they consume. Rethink Paper (www.rethinkpaper.org), a project of EarthIsland Institute, is one of the organizations that can provide valuable information on options for sustainable paper use. (v.12,#4)

Southgate, Christopher, "Peter Murage and the MOOF Project, Nanyuki, Kenya," Ecotheology No 10 (Jan 2001):111-112.

Southgate, Christopher, "God and Evolutionary Evil: Theodicy in the Light of Darwinism," Zygon: Journal of Religion and Science 27(2002):803-824. Southgate's evolutionary theodicy (going beyond his evaluation of accounts of Thomas Tracy, Holmes Rolston, Arthur Peacocke, and John Haught) explores whether Christians in their environmental ethics ought to become redeemers of the evils in evolutionary nature. Rolston finds a "cruciform nature," but it is not enough (as with Rolston) for nature to be regenerated and to evolve higher forms; all the "victims" that have suffered during evolutionary development need also to be redeemed. Nor is it sufficient to have all these myriads of creatures caught up in the evolutionary struggle merely remembered by God.

"Humans have a calling, stemming from the transformative power of Christ's action on the Cross, to participate in the healing of the world" (p. 817). "A calling to be co-redeemers offers humans a more positive role than most proposals in environmental ethics, which tend to emphasize the need for humans to back off from nature. ... Perhaps it is only in being involved, in however deep a humility, in the healing of nature that we can become human beings fully alive. ... Here I postulate that it is humanity that contains the seeds of nature's transformation. ... A redeemed humanity transcends its nature and can thus act on nature to assist in its healing" (pp. 818-819).

Southgate wonders also if the non-human victims of the evolutionary process in the past might not also be redeemed. Christians may need to posit a "pelican heaven" (Jay McDaniel), in which the lives sacrificed in the evolutionary struggle can fulfil their being. Southgate is in theology, University of Exeter, Exeter, UK.

Southgate, Christopher. *The Groaning of Creation: God, Evolution and the Problem of Evil*. Louisville, KY: Westminster John Knox Press, 2008. Southgate develops an extended inquiry into the suffering of nonhuman creatures and discusses how an openness to evolutionary science can deepen and enliven Christian theology's understanding of nature and nature's God. Pain, suffering, and extinction are intrinsic to the evolutionary process. The world that is "very good" (Genesis) is also "groaning in travail" (in a phrase from the Apostle Paul recalling a woman giving birth) and subjected by God to that travail. This ambiguity in creation is essential for accomplishing God's purposes. Southgate interprets this in terms of God's self-emptying and human beings' special responsibilities as created co-creators to care for creation. Southgate is in theology at the University of Exeter (UK).

Southwick, Charles H., "The Biology and Psychology of Crowding in Man and Animals," Ohio Journal of Science 71(no. 2, March 1971):65- . Crowded populations of animals often show a breakdown of normal behavior, with increased aggression and violence, aberrant sexual activity, improper parental care, and abnormal states of activity, aggression, or social withdrawal. A variety of stress-related diseases and mortality patterns may follow. Southwick taught pathobiology, Johns Hopkins University, Baltimore.

Sowards, Stacey K., "Identification through Orangutans: Destabilizing the Nature/Culture Dualism," Ethics and the Environment 11(2006):45-61. The nature/culture dualism has long been criticized for constructing social beliefs, attitudes, and behaviors that fail to respect and value the natural world. One possible way to bridge the divide between the human and non-human worlds is the process of identification. Orangutans, an endangered species found in Indonesia and Malaysia, enable individuals to bridge, connect, and identify with a seemingly separate natural world. Through identification with orangutans, humans come to reevaluate their own perspectives and dichotomous ways of thinking about their relationships with nature. Sowards is in communications at the Sam Donaldson Center at the University of Texas, El Paso. (Eth&Env)

Spaid, Sue, "A political life: Arendtian aesthetics and open systems," Ethics and the Environment 8(no. 1, 2003):93-101. Since the 1990s, artists have broken ground by producing works that are "open systems." That is, they are incomplete, participatory, and elastic. In this paper, I will argue that open systems exemplify Hannah Arendt's conception of vita activa, in contrast to art's traditional role as inspiring vita contemplativa. Such works accommodate Arendt's notion of the political life, since they incorporate process, durability, pluralities of spectators, and unpredictability. Echoing Diotima's interest in immortality, Arendt links beauty to durability. Open systems are particularly durable because we remember them as a public experiences that include participants and spectators. Such performative and pleasurable worldly actions entail aesthetic engagements that are very much in line with Arendt's description of the political life. Spaid is an independent curator. (E&E)

Sparrow, Robert. "The Ethics of Terraforming." Environmental Ethics 21(1999):227-245. It has been argued that human restoration of nature is morally problematic because artificially restored natural entities are artifacts, which are ontologically different from natural entities and hence essentially devoid of the moral standing that natural entities have. I discuss the alleged assimilation of restored natural entities to artifacts, and argue that it does not follow from the ontological differences, if any, between the artifactual and the natural that the former is morally inferior to the latter. This defense against the devaluation of restored natural entities is aimed at narrowing the ethical gap between the wild and the tamed, which is often endorsed by ecocentric environmental ethics. (EE)

Spash, Clive L. "Economics, Ethics, and Long-Term Environmental Damages." Environmental Ethics 15(1993):117-32. Neither environmental economics nor environmental philosophy have adequately examined the moral implications of imposing environmental degradation and ecosystem instability upon our descendants. A neglected aspect of these problems is the supposed extent of the burden that the current generation is placing on future generations. The standard economic position on discounting implies an ethical judgment concerning future generations. If intergenerational obligations exist, then two types of intergenerational transfer must be considered: basic distributional transfers and compensatory transfers. Basic transfers have been the central intergenerational concern of both environmental economics and philosophy, but compensatory transfers emphasize obligations of a kind often disregarded. Spash is in the department of Economics, University of Stirling, Scotland. (EE)

Spash, Clive, L. "Ethical Motives and Charitable Contributions in Contingent Valuation: Empirical Evidence from Social Psychology and Economics." Environmental Values 9(2000):453-479. Abstract: Contingent valuation of the environment has proven popular amongst environmental economists in recent years and has increased the role of monetary valuation in public policy. However, the underlying economic model of human psychology fails to explain why certain types of stated behaviour are observed. Thus, good scope exists for interdisciplinary research in the area of economics and psychology with regard to environmental valuation. A critical review is presented here of some recent research by social psychologists in the US attempting to explain stated behaviour in contingent valuation. Attitudinal scales have been used to analyse the role of ecocentric, biocentric and altruistic motives for giving. However, the research is shown to draw some potentially misleading conclusions and be unrepresentative of contingent valuation. Two recent economic studies using contingent valuation are then reported and shown to have identified non-economic motives for WTP. The complexity of value formation and expression is found to go far beyond that generally accepted by economic models. Greater consideration of the role played by attitudes and ethical considerations then becomes relevant to the interpretation of results being used in standard cost-benefit analysis and environmental policy. Keywords: Attitudes, behaviour, contribution model, contingent valuation, environmental ethics, rights, social psychology. Clive L. Spash, Clive L. "The Development of Environmental Thinking in Economics." Environmental Values 8(1999):413-435. ABSTRACT: There has always been a sub-group of established economists trying to convey an environmental critique of the mainstream. This paper traces their thinking into the late 20th century via the development of associations and journals in the USA and Europe. There is clearly a divergence between the conformity to neo-classical economics favoured by resource and environmental economists and the acceptance of more radical critiques apparent in ecological economics. Thus, the progressive elements of ecological economics are increasingly incompatible with those practising neo-classical environmental economics who try to reduce all concepts to fit within the confines of their models. A group of people can be identified who teach that ecological economics is nothing more than a name for the link between mainstream economics and ecology. A new movement and paradigm are unnecessary for such ends. This viewpoint is argued to be inconsistent with the roots and ideas of the ecological economics movement. Ecological economics is seen here to be synthesising various types of economics (e.g., socialist, institutional, environmental) and moving back to explicit inclusion of ethical issues in the mode of classical political economy. This inevitably means rediscovering neglected past works and exploring new ways of thinking about socio-economics and the environment. Spear, John R., "Conservation Medicine: The Changing View of Biodiversity," Conservation Biology 14(no.6, 2001): 1913-. (v.12,#3)

Specter, Michael, "The Dangerous Philosopher (Peter Singer)" The New Yorker, Sept. 6, 1999, pp. 46-55. Peter Singer has become director of the Princeton University Center for Human Values, but not without controversy. He couldn't be located in the philosophy department, and the biology department had reservations. Perhaps not without some warrant, since he is said to be "the most controversial philosopher alive." But this is not so much for his ethical views on animals as his views on people, which critics complain is a reckless utilitarianism. Singer argues that the two-thousand year old system of ethics protecting the sanctity of life has collapsed and that "it is ridiculous to pretend that the old ethics still make sense when plainly they do not." He argues that a human life is not necessarily more sacred than a dog's, and that it might be more compassionate to carry out experiments on seriously disabled, unconscious orphans than on rats. He argues that parents should kill a disabled infant if they can replace it with one who will be happier.

"Singer's philosophy condemns people for caring more about their families than about strangers." "Singer believes we are obliged to give money away until our sacrifice is of comparable moral importance to the agony of people starving to death. ... One should reduce oneself to very nearly the material circumstances of a Bengali refugee." He also holds "that heroin should be legal since its prohibition has done more harm than good."

Critics also argue that no one can live by Singer's ethics, including Singer himself, since, although he lives modestly and is charitable, has daughters who live comfortably as beneficiaries of a trust fund. Singer's mother, tragically, is in the advanced stages of Alzheimer's disease, and he has

employed, with compassion, a team of health care aides to look after her. Critics say that he is doing the right thing, but that this cannot be justified with Singer's professed ethics.

One Princeton alumnus wrote that, although Singer complains that moral degeneration in the U.S. is worse than anywhere else, in fact Singer's appointment at Princeton is a symptom of, not a cure for, this moral degeneration! On the first day of classes at Princeton, 250 protesters rallied at Princeton's main administration building. Some disabled persons handcuffed their wheelchairs together to block two doors of Nassau Hall, keeping administrators out of their offices until early afternoon. Campus police officers removed the handcuffs and arrested 14 protesters, who were charged with trespassing and disorderly conduct. Steve Forbes, a Republican Presidential candidate who is on Princeton's Board of Trustees, announced that he would not give money to the university until it rescinded Mr. Singer's appointment.

See also Will, George F., "Life and Death at Princeton," Newsweek, September 13, 1999, pp. 80, 82. Will comments that Singer will stimulate serious reflection, and be largely unpersuasive. "Singer does not deny that killing a fetus involves killing life. But he says some infanticide is not even as important as, say, killing a happy cat." George Will himself has a child with Down's syndrome, a child that, in the early stages of its life, Singer might have recommended replacing with another, normal child.

Meanwhile Singer's Practical Ethics has sold 120,000 copies, the best selling book ever published by Cambridge University Press. (v.10,#3)

Specter, Michael, "The World's Oceans Are Sending an S.O.S.," New York Times, May 3, 1992. Full page story. You will probably learn something from this one. "Drift nets can be forty miles long, or large enough to catch Manhattan." "An area of ocean the size of Ohio is swept by high seas fleets each night, and the nets catch virtually everything down to a depth of 30 feet." "The seas are eternal, but so is the river of pollutants." (v3,#2)

Spector, S, "Biogeographic Crossroads as Priority Areas for Biodiversity Conservation," Conservation Biology 16(no.6, 2002): 1480-1487.

Spector, Tom. "Does the Sustainability Movement Sustain a Sustainable Design Ethic for Architecture?" Environmental Ethics 28(2006):265-283. The sustainability movement, currently gathering considerable attention from architects, derives much of its moral foundation from the theoretical initiatives of environmental ethics. How is the value of sustainability to mesh with architecture's time-tested values? The idea that an ethic of sustainability might serve architects' efforts to reground their practices in something that opposes consumer values of the marketplace has intuitive appeal and makes a certain amount of sense. However, it is far from obvious that the sustainability movement provides a strong enough conceptual framework for an entire design philosophy. This issue is complicated by two different sustainable design outlooks which parallel two conceptions of environmental ethics: the practical and the radical. Nevertheless, sustainability need not resort to the philosophical excess of its radical branch to help foster a new public-spiritedness. (EE)

Spedding, C.R.W., "Animal Welfare Policy in Europe", Journal of Agricultural and Environmental Ethics 6(1993). Few European countries have a clear policy on animal welfare, specifying objectives and a strategy for achieving them. The U.K. has a policy of promoting high standards of farm animal welfare by legislation, advice, education and training. The Farm Animal Welfare Council (FAWC) is responsible for defining welfare standards and advising the Minister of Agriculture on appropriate action. A major current constraint on progress is the need to achieve uniformity of standards and practice across the European Community, in order to minimize unfair competition. A range of conventions and other agreements constitute the basis of a common welfare policy throughout Europe, but legislation varies from one country to another. Not all European countries have a body equivalent to FAWC but an attempt is now being made to establish liaison and information exchange between those that exist. This could lead to more effective examination of major welfare problems and better co-ordinated research programs. Spedding is with The UK Farm Animal Welfare Council, Tolworth Tower Surbiton, Surrey, KT6 7DX

Spencer, Daniel T., Gay and Gaia. Cleveland, OH: Pilgrim Press, 1996. 464 pages. \$ 19.95 paper. The author claims we need to rethink our fundamental assumptions about the sacred, ecology, and sexuality. Ecological ethics must become the grounding for all ethics, and genuine justice requires right relations among all of creation, not simply among human beings. We ought to reject a human-centered worldview in favor of an ecocentric worldview. Only when we are able to integrate our sexuality with our spirituality will we fully experience the divine, and fully live out our ethical values. (v7,#4)

Spencer, Gary, New York Law Journal (12/18/98). Rivers and Private Property Rights: Recreational Use Prevents Closing. In a major case that greatly expands the public's right to use rivers on private land, a New York Court of Appeals adopted a new "recreational use" test for when a waterway is navigatable and thus beyond a private landowner's power to close. The Court replaced the old common law standard of a river's capacity for "commercial use" in bringing goods to market with a new test according to which recreational boating alone gives the public a right to use the river. The case dealt with a 12-mile stretch of the South Branch of the Moose River that crosses a 60,000 acre private preserve. The owners of the preserve had kept the river closed to public use for over a century. The ruling also recognized the public's right to portage around obstacles in a stream. (v.9,#4)

Spencer, Stuart, Eddy Decuyper, Stefan Aerts and Johan De Tavernier History and Ethics of Keeping Pets: Comparison with Farm Animals," Journal of Agricultural and Environmental Ethics 19(2006): 17-25. Perhaps the commonest reasons for the keeping of pets are companionship and as a conduit for affection. Pets are, therefore, being used for human ends in much the same way as laboratory or farm animals. So shouldn't the same arguments apply to the use of pets as to those used in other ways? In accepting the rights of farm animals to fully express their natural behavior, one must also accept the right of pets to express their intrinsic natural behavior. Dogs kept in houses for most of the day are being kept in an unnatural environment. So are rabbits kept in hutches, and guinea-pigs or birds in cages. These conditions infringe the animals telos. Dogs are naturally pack animals, so is a dog in isolation being denied its telos? Other actions more deliberately infringe telos and autonomy. Enforced shampooing or

even exercise; hair-cutting of poodles; putting animals in clothes; and tail-docking. If de-beaking of chickens is considered wrong, then the same must be true for tail-docking of dogs. One should also question the ethics of specialist breeding especially when that results in physiological disadvantages (boxers with breathing troubles). There would appear to be no advantage to the animals in having such health problems and when these are the direct result of the breeders desire for specific cosmetic traits, we should question the ethics of the practice at least as much as when animals are bred for specific agricultural traits. Keywords: companion animals - ethics - pets - speciesism The authors are at the Centre for Agricultural Bio- and Environmental Ethics, Katholieke Universiteit Leuven, Leuven-Heverlee, Belgium. Speth, James Gustave. *The Bridge at the Edge of the World: Capitalism, the Environment, and Crossing from Crisis to Sustainability*. New Haven: Yale University Press, 2008. Drawing from nearly four decades of environmental work with NGOs, the United States government, and the UN Development Programme, Speth, now Dean of the Yale School of Forestry & Environmental Studies, begins with the observation that if we continue to do exactly what we do on Earth with no economic or population growth, Earth will soon be an unfit planet on which to live. While the environmental community has continued to grow in strength and sophistication, the environment has continued to decline, and we are now on the edge of catastrophe. Speth argues that the root cause of this is the economic and political system of modern capitalism, and we must turn this system around by developing a new consciousness and new politics that makes the market work for the environment, changes the fundamental dynamics of the corporation, and moves us to a post-growth society that actually promotes the well-being of people

and nature.

Speth, James Gustave, Red Sky at Morning: America and the Crisis of the Global Environment. New Haven: Yale University Press, 2004. Economics has been largely detached from environmental issues; nature is at best a backdrop to economic activity. But now we are in crisis. Sustainable development involves the maintenance of wealth, where the required measure of wealth includes not only manufactured capital (buildings and machinery) and human capital (knowledge, skills, and health) but also natural capital (ecosystems). The natural capital has been too often been unpriced or underpriced without incentive to economize on its use. Speth argues for a new international organization that would act on behalf of the environment in much the way that the World Trade Organization acts on behalf of a rational trading order. Speth is dean of the School of Forestry and Environmental Studies, Yale University. Reviewed by Partha Dasgupta in Science 305(17 September 2004):1716. (v.14, #4)

Spezio, Teresa Sabol. *Mountains in Every Direction: A Place-Based History of the Selway-Bitterroot Wilderness Area*. M.S. Thesis, University of Oregon, 2000. In Chapter III, "The Nimípu (Nez Perce) Relationship with Their Homeland," Spezio does extensive interviews with Native American elders and finds that, although they do not consider themselves "visitors" on the landscape they regularly inhabited, they do recognize "*titoqanót wétes*, peopleless land or wilderness," a pre-contact word that has kept the same meaning throughout the years. The word has many parallels with the definition of wilderness in the U.S. Wilderness Act, "where man is a visitor who does not remain." Such lands were often those high and relatively difficult to reach for the Nimípu for the much of the year. Young men were often sent into this wilderness for a week as a rite of passage to maturity to show their competence on their own. Spezio also cites Haruo Aoka, *Nez Perce Dictionary* (Berkeley: University of California Press, 1994), p. 763. Spezio is currently a Ph.D. student in environmental history at the University of California, Davis.

Spitler, Gene. "Sensible Environmental Principles for the Future." Environmental Ethics 2(1980):339-52. The attitudes of the American public toward the environmental movement may be undergoing change as the economic crunch continues and energy shortages reoccur. The principles underlying the environmental movement need to be defined and examined carefully to determine what makes sense for our changing conditions. An attempt is made to express the two primary ethical principles which have evolved from environmental thinking and, in turn, have influenced the directions taken by the movement. It is argued that these principles must not be accepted uncritically, but rather must be analyzed and subsequently modified to become compatible with more traditional ethical thinking. Such a synthesis is attempted. The modified principles can provide valuable guidance as we make difficult decisions which can influence the future path of life on Earth. Spitler is an Assistant Secretary of Standard Oil Co., Navoto, CA. (EE)

Spitler, Gene. "Justifying a Respect for Nature." Environmental Ethics 4(1982):255-60. Paul W. Taylor has proposed a foundational structure for developing a respect for nature. This structure appears to go well beyond what is needed to justify such respect. The intricacies and nuances of life on Earth can gain

our respect without attempting the impossible task of abandoning our human perspective or a particular interest in our own species. Spitler is in Diversification Research at Chevron Research Co., Navoto, CA. (EE)

Sprigge, T. L. S. Review of Of Mice, Models and Men. By Andrew W. Rowan. Environmental Ethics 8(1986):83-87.

Sprigge, T. L. S., "Some Recent Positions in Environmental Ethics Examined," Inquiry 34(1991):107-28. An examination of three recent books advocating beliefs about, and attitudes toward, wild or semi-wild nature, characteristic of those in eco-philosophy today. Paul Taylor, Respect for Nature; Holmes Rolston, Environmental Ethics; Andrew Brennan, Thinking about Nature. Taylor and Rolston are seen as forms of deep ecology; Brennan's position is humanistic ecology, a middle way between shallow and deep ecology. These authors are interpreted through Sprigge's panpsychism, in which he is sympathetic to the idea that there is value in nature apart from the life of humans and animals. Though Rolston and Taylor disclaim being panpsychists, it is hard to make sense of their claims without moving toward panpsychism, or at least broadening our conception of the distribution of sentience. Even for the panpsychist, however, where it is not the welfare of individual organisms that is in question, but the alleged value of units such as total ecosystems, species, or terrains, appeal must be mainly to aesthetic value. For even if there is a

world of inner feeling in nature, we must remain so ignorant of its character, except when it rises to the animal or human level, that we cannot do very much about it. The best answer to the question of the human role in nature lies in a special sense of oneness with the wider system of things which humans can obtain when away from human restrictions, even though nature is just as much there in much of the apparently humanized world. Sprigge is emeritus in philosophy at the University of Edinburgh. (v.8,#4)

Sprigge, T. L. S., "Idealism, Humanism, and the Environment," in Coates, Paul and Hutto, Daniel D., eds., Current Issues in Idealism. Bristol, England: Thoemmes Press, 1996), pp. 267-302. "My main conclusion is that absolute idealism, conceived as the view that Reality is 'a single Experience, superior to relations and containing in the fullest sense everything which is' (quoting Bradley), need not be, and should not be, in any way metaphysically humanist or vitalist, and that there is no reason therefore for those, like the deep environmentalists who are repelled by ethical humanism or even vitalism, and by metaphysical humanism or vitalism as implying it, to regard absolute idealism in general with suspicion; indeed they should recognize it as rather their best metaphysical friend, since it gives ground for recognizing as cognitively valid the pantheistic feelings towards nature which often inspire them. Sprigge is emeritus in philosophy at the University of Edinburgh. (v.8,#4)

Sprigge, T. L. S., "Non-human Rights: An Idealist Perspective," Inquiry 27(1984):439-461. The question whether an entity has rights is identified with that as to whether an intrinsic value resides in it which imposes obligations to foster it on those who can appreciate this value. There should be no difficulty in granting that animals have rights in this sense, but what of other natural objects and artifacts. It seems that various inanimate things, such as fine buildings and forests, often possess such intrinsic value, yet since they can only be fully actual in an observing consciousness the most basic such right is that of being observed from time to time. That at least is true of them as phenomenal objects. There must, however, be a thing in itself behind the phenomenal object and sometimes this may possess an intrinsic value which gives rise to rights, not a matter of the need to be actualized in an observing consciousness, though it is extremely difficult to reach reliable conclusions here. Sprigge is emeritus in philosophy at the University of Edinburgh.

Sprigge, T. L. S. (Philosophy, University of Edinburgh, Scotland), "Some Recent Positions in Environmental Ethics Examined: a Review" in Inquiry 34(1)(1991):107-128. Critiques Holmes Rolston, Environmental Ethics; Paul Taylor, Respect for Nature, and Andrew Brennan, Thinking about Nature: An Investigation of Nature, Value and Ecology.

Sprigge, T.L.S., "Are There Intrinsic Values in Nature?" Journal of Applied Philosophy 4, no. 1 (1987): 21-28. Sprigge argues that all value must be appreciated by a conscious evaluator, and thus, that if there are intrinsic values in nature we must subscribe to a panpsychist metaphysics, such as we discover in Royce, Fechner, or Whitehead. But his argument rests on the trivial point that if we imagine a nature without any conscious human valuers, we are conscious of it in our imagining. "I cannot make sense of [the world's] existing in some unexperienced manner" (p. 25). (Katz, Bibl # 1)

Sprugel, D. G., "Disturbance, Equilibrium, and Environmental Variability: What is 'Natural' Vegetation in a Changing Environment?" Biological Conservation 58(1991):1-18. On human scales many landscapes appear little changing. Early ecologists supposed that, despite disturbances, natural ecosystems reached a stable climax. More recently, scientific studies have discovered that many of these landscapes are non-equilibrium. They do change over hundreds of years. Examples: African savannas, the Big Woods of Minnesota, the lodgepole forests of Yellowstone National Park, and possibly the old-growth Douglas-fir forests of the Pacific Northwest. The changes are introduced by climate change, by erratic storms, by periods of drought. "The notion of 'natural' vegetation or ecosystem processes need not be abandoned as a goal for park or reserve management, even though it must be revised to recognize that there is a range of ecosystems that can legitimately be considered 'natural' (p. 15). Sprugel is in forestry, University of Washington, Seattle.

Squadrito, Kathleen M. "Locke's View of Dominion." Environmental Ethics 1(1979):255-62. I examine the extent to which Locke's religious and political ideology might be considered to exemplify values which have led to environmental deterioration. In the Two Treatises of Government, Locke appears to hold a view of dominion which compromises humanitarian principles for economic gain. He often asserts that man has a right to accumulate property and to use land and animals for comfort and convenience. This right issues from God's decree that men subdue the Earth and have dominion over every living thing. Although abuse of the environment appears to be justified in Locke's political works, I argue that there are many passages in this work that cast doubt on such an interpretation. Further, the view of dominion adopted in Locke's educational work is one of responsible stewardship. On the whole, his view stresses man's duties and obligation towards all creation. Squadrito is in the philosophy department, Indiana University-Purdue University, Fort Wayne, IN. (EE)

Stackhouse, Max L., Dennis P. McCann and Shirely Roels, with Preston N. Williams, eds. On Moral Business: Classical and Contemporary Resources for Ethics in Economic Life. Grand Rapids, MI: Eerdmans, 1996. 979 pages. \$ 35.00 paper. The primary editors believe that we today live in a global, post-socialist economy, and that the Soviet bloc's collapse thoroughly disposed of any naive belief in socialism. At the same time, all too many religious leaders and other ethicists cling to the belief that capitalism is greedy, individualistic, exploitative and also failing. What is needed is a post-socialist faith that can transform the contemporary business corporation, for this peculiarly modern and increasingly powerful human organization holds both promise and threat to humanity. In the U.S. at least, Christians are a sizeable enough force within corporations--as managers at all levels--that the work of making business a positive and creative force is both feasible and necessary. With articles by Wendell Berry and James A. Nash making strong claims about the coming environmental crisis. Reviewed by Daniel Finn in Christian Century, April 24, 1996, who replies, "No matter how dead socialism looks in the U.S., it would be good to invite some debate about it."

Stackhouse, Max L., with Paris, Peter J., eds., God and Globalization, Volume 1: Religion and the Powers of the Common Life. With Obenchain, Diane B., God and Globalization, Volume 3: Christ and the Dominions of Civilization. Harrisburg, PA: Trinity Press International, 2001, 2002. Thinking globally and trying to make sense of a shrinking world. Ecumenical and interfaith movements constitute a religious dimension of globalization. Religion in various forms is--and should be--an actor in globalization. Globalization should neither be welcomed uncritically nor dismissed as wholly deleterious. We need better conceptions of global justice and of human redemption.

Stackhouse, Max. *God and Globalization: Volume 4, Globalization and Grace*. New York: Continuum Books, 2007. God's loving mercy is manifest in globalization, though many pastors and secularists see globalization as a soulless mechanism. Globalization holds unparalleled opportunities and responsibilities for Christian believers and world citizens. Globalization is creating a new transnational kind of affiliation—a global civil society—that will simultaneously fulfill and modify core Christian ideals. It is creating an expanded political public, a morally enriched domain of free association. Globalization has already lifted hundreds of millions out of poverty and created newly empowered middle classes throughout the developing world.

Staebler, Rebecca N., "Forestry and Foresters: Looking Back 100 Years," Journal of Forestry 98(no.11, NOV 01 2000):4- . In 1903 Theodore Roosevelt told a gathering of the Society of American Foresters that there were no greater body "who have in their power to do greater service to the country". This commemorative issue shows how well foresters and SAF have lived up to Roosevelt's charge during our first 100 years. (EE v.12,#1)

Stafford, Barbara Maria, "Toward Romantic Landscape Perception: Illustrated Travels and the Rise of 'Singularity' as an Aesthetic Category," The Art Quarterly 1(no. 1, 1977):89-124. Scientific travel literature in the eighteenth century gave rise to an interest in lone, visually distinctive landscape configurations. "The dominant natural configuration, demanding immediate respectful attention, became a potent feature of scientific travel literature and created an aesthetic category of its own: that of singularity" (p. 89). This "relates to the voyager's absorption in what he sees to such a point that the obliteration of his own identity results. The becoming one with the singularity beheld is a riveting of the imagination to its object in a passionate identification with it" (pp. 113-114).

Stanford, Craig B., The Hunting Apes: Meat Eating and the Origins of Human Behavior. Princeton, NJ: Princeton University Press, 1999. 262 pages. \$ 25. What made humans unique was meat, the desire for meat, the eating of meat, the hunting of meat, the sharing of meat. Being a "clever, strategic, and mindful sharer of meat is the essential recipe that led to the expansion of the human brain." From analyses of the behavior of chimps and other great apes, and existing human hunting and gathering societies, Stanford claims that meat eating has been central to human evolution. Meat provides a highly concentrated source of protein, essential for the development and health of the brain, and is craved by many primates, including humans. This craving has given meat genuine power--the power to cause males to form hunting parties and organize entire cultures around hunting. And it has given men the power to manipulate and control women in these cultures. Steven N. Austad comments in Natural History: "I justify my meat eating by tradition. As Craig Stanford's book makes abundantly clear, my ancestors have been killing and eating meat for more than five million years. What kind of egotist would it take to break a tradition like that?" (Perhaps Austad continues to dominate his women too!) Although Stanford

portrays "the roots of human behavior as manipulation and cunning that arise from the use of meat by our ancestors," he, at least, concludes that we are not biologically driven to do any of these things and that we are not innately aggressive demons. Stanford is in anthropology at the University of Southern California. (v10,#4)

Stange, Mary Zeiss. Woman the Hunter. Boston: Beacon Press, 1997. A reintroduction of women as hunters can defy traditional stereotypes of man the hunter and woman the gatherer. Hunting "encapsulates a worldview that locates humans in the natural scheme of things in a markedly different way from agriculture or industry. It affords a mode of conscious participation in natural life that is unavailable elsewhere" (p. 124). Woman the Hunter understands that "everything that lives will die. And out of its dying others will live" (p. 176). Reviewed by Greta Gaard, Environmental Ethics 22(2000):203-207. (v.11,#3)

Star, L., E. D. Ellen, K. Uitdehaag and F. W. A. Brom, "A plea to implement robustness into a breeding goal: poultry as an example," Journal of Agricultural and Environmental Ethics 21(2008):109-125. The combination of breeding for increased production and the intensification of housing conditions have resulted in increased occurrence of behavioral, physiological, and immunological disorders. These disorders affect health and welfare of production animals negatively. For future livestock systems, it is important to consider how to manage and breed production animals. In this paper, we will focus on selective breeding of laying hens. Selective breeding should not only be defined in terms of production, but should also include traits related to animal health and welfare. For this we like to introduce the concept of robustness. The concept of robustness includes individual traits of an animal that are relevant for health and welfare. Improving robustness by selective breeding will increase (or restore) the ability of animals to interact successfully with the environment and thereby to make them more able to adapt to an appropriate husbandry system. Application of robustness into a breeding goal will result in animals with improved health and welfare without affecting their integrity. Therefore, in order to be ethically acceptable, selective breeding in animal production should accept robustness as a breeding goal. The authors are at the Animal Breeding and Genomics Centre, Wageningen University, Wageningen, The Netherlands.

Starik, Mark, "Should Trees Have Managerial Standing? Toward Stakeholder Status for Non-Human Nature," Journal of Business Ethics 14(1995):207-217. Most definitions of the concept of "stakeholder" include only human entities. The non-human world can be integrated into the stakeholder management concept. The natural environment is finally becoming recognized as a vital component of the business environment; the stakeholder concept is more than a human political/economic one, and non-human nature currently is not adequately represented by other stakeholder groups. In addition, any of several stakeholder management processes can readily include the natural environment as one or more stakeholders of organizations. This integration would provide a more holistic, value-oriented, focused and strategic approach to stakeholder management, potentially benefiting both nature and organizations. Starik is professor of strategic management and public policy, The George Washington University.

Stark, Judith, "Ethics and ecotourism: connections and conflicts," Philosophy and Geography 5 (No. 1, 2002): 101-113. In this essay the author examines the burgeoning industry of ecotourism, analyzing

definitions of "ecotourism" and exploring a number of compelling issues raised by the recent trend in worldwide tourism. She then examines three sample codes of ecotourism: one site-specific (Antarctic Traveler's Code), one from a major environmental group (National Audubon Society), and one developed by a consultant for a travel research firm (Code for Leisure Destination Development). The presuppositions, value and limitations of these codes are then analyzed. On the basis of this analysis, the author proceeds to a discussion of the frameworks for negotiating discourses about ecotourism. Stark argues that the limitations detected in the sample codes of ethics for ecotourism would be fruitfully addressed by Jürgen Habermas's discourse ethics augmented by the feminist ethical and political theories of Seyla Benhabib who draws on the work of Hannah Arendt. While bracketing the debates surrounding the justification of Habermas's principle of universalizability, the author argues that the over-emphasis on the rational aspects both of the principle itself and on the notion of "rational trust" stand in need of a corrective if discourse ethics is to be used successfully in negotiating real-life conflicts. Stark argues for a kind of "application discourse" using the feminist ethical and political theories of Benhabib drawn from Arendt's work in which "associational public spaces" are created through relational processes in the acts themselves of meeting and discourse. The author claims that Benhabib and Arendt's works contain fruitful theoretical approaches that also leave room to deal with policies and practical applications as debates about ecotourism increase around the world. Far from exhausting the possibilities, this essay opens up the connections between these theoretical approaches and a new area of environmental concern—ecotourism. Stark is an associate professor of philosophy at Seton Hall University in New Jersey. (P&G)

Steady, Filomina Chioma, "Women, Shelter and the Environment." Environmental Values Vol.2 No.2(1993):163-176. ABSTRACT: The aim of this paper is to point out the logic of the links between shelter, women and the environment in order to understand this important dimension of the crisis in human settlements, particularly in the provision of human shelters. It also discusses the relationship of this crisis to processes of development which are both unsustainable and detrimental to the well-being and socio-economic situation of people in general, and women and children in particular. This paper then attempts to evaluate the effect of development strategies that aim to alleviate the problem and examines some successful initiatives which have promoted both sustainable development and the involvement of women in sustainable human shelter activities. It finally argues that solutions to the problem of human shelter will be ineffective without consideration of women's needs, concerns and contributions in this important aspect of sustainable development. Steel Brent S., Peter List, and Bruce Schindler, "Conflicting Values About Federal Forests: A Comparison

of National and Oregon Politics," Society and Natural Resources 7(1994):137-153. Both national and Oregon publics are more biocentric than anthropocentric in general orientation toward federal forests, though the national public is more strongly biocentric than the Oregon public. A biocentric orientation does not give primacy to human interests but places them in a nature-centered or ecocentric approach. It does not deny that human values are important, but places these in a larger context, finding inherent as well as instrumental value in nature. Among the public, younger persons, women, members of environmental organizations, liberals, and postmaterialists are significantly more biocentric than older persons, men, those economically dependent on timber, conservatives, and materialists. One can predict that biocentric orientations will increase in the future, and agencies that manage resources with traditional anthropocentric orientations, such as the U.S. Forest Service and the Bureau of Land Management, are likely to encounter steadily more resistance from the public. Steel is in political science at Washington State University, Vancouver; List in philosophy, and Shindler in forest resources at Oregon State University. (v5,#4)

Stefanovic, Ingrid Leman. "Phenomenological Reflections on Ecosystem Health." Ethics and the Environment 5(2000):253-270. ABSTRACT: That the notion of ecosystem health is of central importance to environmental policy making is clear, even from a cursory survey of landmark documents. The World Commission on Environment and Development (1987) has declared good health to be "the foundation of human welfare and productivity" and "a broad-based health policy" to be essential for sustainable development. The Rio Declaration similarly advocates a global partnership to "conserve, protect and restore the health and integrity of the Earth's ecosystem," and the International Society for Ecosystem Health at the University of Guelph concludes that the idea of health "provides an immediate

and powerful approach" to the challenge of overcoming the earth's environmental crisis.

As frequently as we refer to the concept of health, we rarely explore in explicit terms what we mean. How does one define health? Perhaps, as St. Augustine found himself understanding well the notion of time until he was asked to define it, similarly we take for granted that we agree on the meaning of health until we are asked to achieve a universal consensus on our mutual conceptions of the term. If we were to collectively attempt to define the concept of health, would our definitions converge?

Some philosophers might argue that fruitful policy making cannot proceed in the absence of a clarification of the meaning of the terms that are employed. As logical as this conclusion may sound, it is not completely justified. Moreover, our understanding of the concepts of human and ecosystem health can nevertheless be enlarged, even if we do not achieve consensus on definitions. (E&E)

Steffen, Lloyd H. "In Defense of Dominion." Environmental Ethics 14(1992):63-80. The biblical notion of dominion has often been cited as the source and sanction for Western attitudes of environmental disregard. An analysis of the Genesis passage in which dominion (radah) is mentioned reveals a curious misreading of the text: dominion is actually an ideal of human-divine intimacy and peacefulness--as one ought to expect in a paradise creation story. I analyze Genesis dominion not only as a religious concept, but also as a philosophical notion manifesting the Hebrew selfunderstanding of its contemporary experience with the natural world. Being a verb, radah is also an action concept that connotes an ethic of environmental responsibility. Dominion authorizes a philosophical critique of Western attitudes and practices of environmental exploitation. I defend it here as an intentional expression of the Western religious consciousness that could, if it were understood as an ideal of responsible action rather than as an authorization for callous disregard of the natural world, actually promote interreligious dialogue on environmental issues. Steffen is University Chaplain and in the department of religious studies, Lehigh, University, Bethlehem, PA. (EE)

Steffen, Lloyd. "What Religion Contributes to an Environmental Ethic." *Environmental Ethics* 29(2007):193-208. Religion and ethics overlap and are in many respects related; yet, they differ in their primary focus of concern. Ethics projects are anthropocentric in that they are constructed in the context of self-other relationships, which includes human beings in relation to the "other" of the natural world, and even religious ethics reflect this relational structure. Religion, however, is focused on the human relation to ultimacy and presents a distinctive consciousness of the self and its relations, including relation to the natural world. As religion decenters the self and reframes how the self is related to the other of the natural world - Thomas Merton and Thich Nhat Hanh articulate this distinctively religious consciousness in relation to the environment - religious consciousness can provide positive support for actions of care and regard toward the natural world. But religion need not go this direction. Focused as it is on ultimacy,

which is a power concept that can be dangerous, religion can also sponsor destructive environmental action. Although religion can, indeed, yield in distinctive ways actions and attitudes that amount to support for an ethic of positive regard for the natural world, religiously inspired actions must always be subject to moral critique. Steinbrecher, Ricarda A. "From Green Revolution to Gene Revolution: The Environmental Risks of Genetically Engineered Crops," The Ecologist 26(no.6, 1996):273. Many interest groups claim that an increasing world population cannot be fed unless genetically engineered crops are grown. Such crops, so the theory goes, will produce higher yields than conventional farming methods and have fewer adverse environmental impacts because the frequency, range and toxicity of weed-killer and pesticide applications will be reduced. Ecological risk assessments are said to indicate that several products can be grown safely on a wide scale. In fact, growing genetically engineered plants is likely to increase the use of herbicides and pesticides and to accelerate the evolution of "superweeds" and "superbugs". Crucially, major environmental risks are unpredictable effects and the unintended transfer of transgenes to plant relatives. Risk assessments are limited and have primarily been based on an outdated understanding of gene behavior. (v8,#2)

Stenholm, Charles W. and Waggoner, Daniel B., "Animal Agriculture Production and Research in the 1990s: A View From Capitol Hill", Journal of Agricultural and Environmental Ethics 6(1993). Animal agriculture production systems vary throughout the world, but many of the limitations and complexities of production are universal. It is common to attempt comparisons among management systems, even though systems may differ in several features. A sound animal husbandry program should provide a system of care that permits an animal to grow, mature, reproduce and maintain general health. Animal welfare concerns relate to housing, reproduction, confinement, feeding, health, slaughter and research. Factors driving the increased interest in farm animal well-being are varied and complex, and the issues are unfortunately often evaluated on emotional grounds rather than on a factual, scientific and rational basis. The scientific community should develop "best management practices" that enhance profitability, stewardship and sustainability for producers. Unfortunately, the need for expanded work in animal behaviour and related areas comes at a time of shrinking federal and private research budgets. Effective farm animal quality assurance programs should be developed which are targeted towards providing an educational and training format for producers. All parties must be willing to inform the public truthfully about farm animal welfare, particularly scientifically sound production practices. Stenholm is Chairman of United States House Subcommittee on Livestock, Dairy, and Poultry, 1226 Longworth Building, Washington, DC 20515. Waggoner is Staff Director of United States House Subcommittee on Livestock, Dairy, and Poultry, 1301 Longworth Building, Washington, DC 20515.

Stenmark, Mikael, Environmental Ethics and Policy Making. Aldershot, UK: Ashgate, 2001. Originally in Swedish, 2000; here in English translation. Stenmark analyzes how environmental ethics informs environmental policy and sustainable development. What people do depends on why they do it. There is often critical divergence between anthropocentric, biocentric, and ecocentric ethical perspectives. Different convictions can involve different duties (contrary to Bryan Norton's "convergence hypothesis), here applied to concerns about population, future generations, agriculture, endangered species, and wilderness. Much attention to UN and UNCED documents. Extensive analysis of Aldo Leopold, Tom Regan, Paul Taylor, J. Baird Callicott, and Holmes Rolston. "In conclusion, ... anthropocentrism, biocentrism and ecocentrism generate different views about the direction of current environmental policy making and management, and ... lack of unity at the ethical or normative level cannot therefore be ignored" (p. 147). Stenmark is "trying to create a bridge between ethical theory and practice" (p. 143). Stenmark is in theology, Uppsala University, Sweden. (v.12,#4)

Stenmark, Mikael. "The Relevance of Environmental Ethical Theories for Policy Making." I address the issue of whether differences in ethical theory have any relevance for the practical issues of environmental management and policy making. Norton's answer, expressed as a convergence hypothesis, is that environmentalists are evolving toward a consensus in policy even though they remain divided regarding basic values. I suggest that there are good reasons for rejecting Norton's position. I elaborate on these reasons, first, by distinguishing between different forms of anthropocentrism and nonanthropocentrism, second, by contrasting the different goals that anthropocentrists, biocentrists, and ecocentrists set up for environmental policy making, and, lastly, by identifying three important policy areas (population growth, wilderness preservation, and wildlife management) where differences in basic values generate divergent policies. Environmental Ethics 24(2002):135-148. (EE)

Stenson, Anthony J., and Tim S. Gray. "An Autonomy-Based Justification for Intellectual Property Rights of Indigenous Communities." Environmental Ethics 21(1999):177-190. The claim that indigenous communities are entitled to have intellectual property rights (IPRs) to both their plant varieties and their

botanical knowledge has been put forward by writers who wish to protect the plant genetic resources of indigenous communities from uncompensated use by biotechnological transnational corporations. We argue that while it is necessary for indigenous communities to have such rights, the entitlement argument is an unsatisfactory justification for them. A more convincing foundation for indigenous community IPRs is the autonomy theory developed by Will Kymlicka. (EE)

Stephens, Piers H.G. "Nature, Purity, Ontology." *Environmental Values* 9(2000):267-294. ABSTRACT: Standard defences of preservationism, and of the intrinsic value of nature more generally, are vulnerable to at least three objections. The first of these comes from social constructivism, the second from the claim that it is incoherent to argue that nature is both 'other' and something with which we can feel unity, whilst the third links defences of nature to authoritarian objectivism and dangerously misanthropic normative dichotomies which set pure nature against impure humanity. I argue that all these objections may be answered by recasting the relationship between man and nature into a tripartite spectrum of ontological form between nature and artifact, with the key question being the extent to which nature has been humanised in accordance with certain modes of strongly instrumental rationality, these in turn being defined by reference to the split between abstract reason and natural feeling which was exacerbated by specific elements in the Enlightenment period. This new model may grant normative force by linking external nature to a broader conception of human psychological wellbeing than that offered by the quantitatively orientated models of human rationality and agency. Stephens, Piers H.G. "Blood, not Soil: Anna Bramwell and the Myth of 'Hitler's Green Party'", Organization and Environment 14 (No. 2, June 2001) pp.173-87. The anti-green backlash that began in the 1990s has constantly advanced charges of misanthropic extremism against ecologists, most dramatically illustrated by claims of historical or thematic linkage between ecologism and Nazism, mainly drawn from Anna Bramwell's work. The author analyses Bramwell's work both historically and systematically, arguing first that her claims of association between ecologism and Nazism are historically flawed, and second, that her conceptual treatment fails to take into account the central motivational roles of Social Darwinism and absolutist purity in National Socialism. These factors effectively divorce green thought about nature from Nazi connection. The author concludes that Bramwell fails to demonstrate any clear historical or conceptual link between ecologism and Nazism, but that greens should nonetheless eschew dangerous purity notions if possible. Stephens, William O., "Stoic Naturalism, Rationalism, and Ecology." Environmental Ethics 16(1994):275-286. Cheney's claim that there is a subtextual affinity between ancient Stoicism and deep ecology is historically unfounded, conceptually unsupported, and misguided from a scholarly viewpoint. His criticisms of Stoic thought are thus merely ad hominem diatribe. A proper examination of the central ideas of Stoic ethics reveals the coherence and insightfulness of Stoic naturalism and rationalism. While not providing the basis for a contemporary environmental ethic, Stoicism, nonetheless, contains some very fruitful ethical concepts. Stepien, Kathy Ann, Does an Ecological Self Need an Environmental Ethics? An Analysis and Critique of Warwick Fox's Deep Ecology. M.A. thesis, Colorado State University, Fall 1999. Warwick Fox's interpretation of the deep ecological position takes Self-realization as the fundamental norm, a self essentially interconnected with all other entities, and contrasted with a tripartite conception of the self in traditional accounts. Fox rejects the need for environmental ethics, as a result of his expanded sense of self. The self's behavior is internally motivated, not externally regulated. But this is a mistake; rather a deep ecological ethics is in fact needed, offering much-needed moral reasoning to the expanded self, making difficult decisions in the real world. Rejected environmental ethics is reaffirmed, enabling the moral development of the expanded self, seeking to care in a complex world. The advisor was Holmes Rolston. Stepien, who is also a physical therapist, now lives in Alaska in a cabin outside Juneau (where she drinks the water that runs off her roof into a cistern) and assists in some teaching at the University of Alaska--Southeast in Juneau. Stapp, Holly E., "Logging Suspended in the Boone," Lexington (Kentucky) Herald-Leader, 17 June 1997, pp. A1, A6. Logging Suspended in Daniel Boone National Forrest (Kentucky). The U.S. Forest Service has temporarily suspended almost all logging on the Daniel Boone National Forrest as a result of a ruling by U.S. District Court Judge Karl Forester. The ruling blocked only a proposed sale of timber from 200 acres near the Red River Gorge. All commercial logging is prohibited in the Gorge. Judge Forester, in a sharply worded decision, ruled that the Forest Service had violated the Endangered Species Act by not giving top priority to protecting the endangered Indiana bat; violated the National Forest Management Act by drawing up policies without obtaining public comment; and violated the National Environmental Policy Act by failing to prepare an environmental impact statement before deciding to sell the trees.

Although the ruling applied only to this particular sale, the Forest Service decided to suspend all logging since they had followed standard Forest Service procedure for this sale. They are considering appealing the decision to the 6th Circuit U.S. Court of Appeals. The Forest Service is being represented by Kelly Mofield, an attorney for the U.S. Department of Justice. The suit was brought by Kentucky Heartwood, an environmental activist organization that opposes all timber sales on national forests and that has filed lawsuits against virtually every sale on the Boone. The ban will result in about 100 workers losing their jobs. Timber sales from the Boone are only 5% of state's total. Also, since government agencies do not pay local taxes, the Forest Service voluntarily gives 25% of the gross from all sales on the Boone to the counties where the timber is located. (v8,#2)

Stern, PC, "Deliberative Methods for Understanding Environmental Systems," BioScience 55 (no. 11, November 2005): 976-982. Environmental problem solving needs science but also inevitably requires subjective judgment. Science can help in dealing with subjectivity, because scientists have long experience developing institutions and practices to address the subjective and value laden choices that are essential to scientific progress. Democracy has also developed approaches to the problem. The underlying principles can be applied to environmental policymaking. This article explores these issues in the context of decisions about environmental risks, drawing on the work of the National Research Council and other sources. It suggests some guidelines for risk deliberation including broad based participation, commitment to scientific quality, explicit attention to values, transparency of processes, etc.

Stevens, W. K., "Debating Nature of Nature in Yellowstone," New York Times, 7/23/98 and McMillion, Scott, "Scientists Examine Park Policy," Bozeman Chronicle, 7/12/99. Scientists study natural regulation of Yellowstone Park. The National Academy of Sciences is carrying out a congressionally mandated study of the scientific claims surrounding the controversy over the National Park Service's management philosophy of "natural regulation." The philosophical questions are just as much in need of study. The policy of letting nature take its course, says Yellowstone's chief scientist John Varley, involves a *laissez-faire*, hand's-off approach, except when intervention is required to fix a human-caused problem. Says Varley, "If nature is making all the right decisions, then you let nature make the decisions, but if there is something dysfunctional caused by humankind, then we need to go in and fix it." For example, the size of the Yellowstone elk herd, once managed by park officials, is now allowed to fluctuate in response to changes in climate, food supply, and pressure from predators. The recent restoration of wolves to the park can be seen as correcting an earlier human-caused dysfunction in the system.

This policy is pregnant with questions for environmental philosophers: What if the "dysfunction" in the system is not caused by humans? Does the policy acknowledge the possibility of such dysfunction? And how is dysfunction to be defined, given the instability typical of many natural systems? Critics of the policy claim that the elk herd has severely overgrazed and degraded the northern range in the park, with devastating affects on cottonwood, willow and aspen trees, beaver populations, and stream sides. Others dispute these claims, suggesting that the critics see overgrazing because they believe the ecosystem should look like one managed to produce maximum grass for cattle, an inappropriate standard for a wild landscape. Other critics deny that it even makes sense to speak of natural regulation of a bioregion that--despite being "the only scrap of land in the lower 48 states that has all the major species known to live there in pre-Columbian times"--continues to be significantly influenced by humans. They point out that each year the elk herd migrates outside the park "where they leave natural regulation behind and human predation becomes a major player." Montana wildlife officials encourage hunters to kill lots of elk (typically anywhere from 10 to 20% of the herd) to keep them from degrading habitat. Another critic calls Yellowstone's northern range an "ecological slum" and argues that Native Americans should be allowed to "camp there all summer and shoot all the elk they want" thus controlling the elk population as he believes they did for 12,000 years before the park was formed.

A further question concerns the rationale for natural regulation. The park superintendent Michael Finley claims the reason for "hands lightly on the tiller" in Yellowstone is that too little is known about the ecosystem's functioning to be confident of the impact of human action. He cites John Muir's famous dictum about interconnectedness "when you try to pick one thing out of the universe you find it hitched to

everything else." This suggests that should we come to have sufficient knowledge of how ecosystems like Yellowstone work, we should abandon natural regulation and take control of nature's tiller. (v.10,#2)

Stevens, W. K., "Tentative Accord is Reached to Cut Greenhouse Gases," New York Times (1/11/97): A1. Kyoto Greenhouse Gas Accord Reached. One hundred and fifty nations meeting in Kyoto, Japan reached an agreement that would legally obligate the industrialized nations to cut greenhouse gas emissions by an average of 5.2 percent below 1990 levels. The accord was reached when the United States agreed to a 7 percent reduction by 2010, dropping its earlier less stringent target of simply reducing emissions to 1990 levels, rather than below them. This is a significant goal, for current trends in U.S. energy use would result in U.S. greenhouse gas emissions being 30 percent higher in 2010. To meet these goals, people will have to start driving more efficient vehicles, power companies will have to alter their methods of producing energy, and consumers will have to buy more energy-efficient appliances. Industry and labor groups are fighting the treaty, predicting that it would lead to a loss of millions of jobs and, for example, a decrease in farm income of 50%. The treaty includes provisions for emissions trading whereby one country or company can meet its reduction targets by buying credits from others countries or companies that have exceeded their targets. It also provides incentives for transferring energy-efficient technologies and nonpolluting forms of energy production from richer nations to poorer ones. It is unclear if the U.S. Senate will sign the treaty as it had previously strongly endorsed the idea that greenhouse gas reduction by developing nations like China must be included, something the treaty failed to achieve. The Clinton Administration continues to seek "meaningful participation" by the developing world in controlling greenhouse gases and said it won't submit the treaty for Senate ratification until this is achieved. While it is imperative that the developing nations not repeat the industrialized world's high pollution path to development, fairness dictates that the developed world--which caused the global warming problem--should shoulder the vast majority of the burden of its solution. (v.8,#4)

Stevens, William K., "One in Every 8 Plant Species Is Imperiled, A Survey Finds," New York Times (4/9/98): A1. Ninety percent of the plants on the list are native to only one country, thus making them especially vulnerable. The U.S. rate is so much higher because plants were likely better surveyed there than elsewhere. Two years ago the union placed nearly one quarter of mammals species and 11 percent of birds on the list. Ecologist Stuart Pimm claims that the latest report is one more piece of evidence that "a whole chunk of creation is at risk." "All the evidence is that the destruction is continuing at an accelerating pace."

Stevens, William K., "Humanity Confronts its Handiwork: An Altered Planet Whose Vast Resilience is Stretched to the Limit." New York Times, May 1, 1992. Full double page spread following a half page lead story in the Science Times section. Nothing new here for those who are regular readers about environmental issues, but the article does show intense concern and communicate this well to the enormous New York Times reader audience. (v3,#2)

Stevens, William K., "Red Foxes Thrive in Suburban Woods," New York Times, May 5, 1998, B13, B17. Red foxes are doing well and quite adaptable to rural and suburban living, fortunately, since the red fox is considered one of the most clever and beautiful animals in the world. One reason may be that they are rather cat-like canines. (v9,#2)

Stevens, William K., Miracle Under the Oaks: The Revival of Nature in America. New York: Pocket Books, 1995. 332 pages. Illustrated. \$22. Tells the story of how teams of volunteers have adopted and rehabilitated parcels of land. (v6,#2)

Stevens, William K., "Dead Trees and Shriveling Glaciers as Alaska Melts," New York Times, August 18, 1998, B7, B10. Alaska is thawing and much of northern Russia and Canada with it, and many think this is one of the most telling signs of global warming. Experts have long said this bellwether region

should warm more and faster than Earth as a whole. The Columbia Glacier has retreated more than eight miles in the last sixteen years. Warmer temperatures have encouraged beetle epidemics in spruce forests. There is a longer growing season but less rain. Melting permafrost ruins roads, telephone poles, and trees sink into swamps. (v.9,#3)

Stevens, William K., "Suspects in 'Blitzkrieg' Extinctions: Primitive Hunters," New York Times (3/28/00). Evidence for Human-caused Blitzkrieg Extinctions. A new study suggests that stone-age Polynesian's colonizing New Zealand drove an entire class of flightless birds called moas to extinction in less than 160 years. There were 11 species of moa and an estimated 160,000 individuals. Some stood 10 feet tall and weighed over 500 pounds. Radiocarbon dating of campsite materials suggest the earliest arrival of Polynesians was in the 13th century. Archaeological analysis of moa remains in the campsites show that none were killed after the 14th century. Estimates of numbers of Polynesian colonists and reproductive rates of moas were also used in the study. One expert on ancient extinctions claims that there is "no way of interpreting this record other than that it had to happen virtually overnight" and that the evidence makes a "really very impressive" case for hunting as the prime cause. Another says that this study's results "reinforce the view that people with even the most basic technologies--fire, clubs, snares--can have major environmental effects." As with the moas in New Zealand, large-scale extinctions of big animals have often coincided with the arrival of early humans in places they had never been before. That such large-scale extinctions did not happen in Africa may be because people and animals evolved together there and thus African animals were not naive about humans. The extinctions in North America of mammoths, mastodons, camels, ground sloths, saber-toothed cats, etc., 13,000 years ago is believed to have occurred in about 400 years. Three causes have been suggested for that extinction event: (1) That humans swept across the continent from Siberia in a killing front that moved about 100 miles a decade; (2) That these animals were killed by diseases carried by the newly-arriving humans and their dogs; (3) That rapid climate change played the major causal role. (v.11,#1)

Stevens, William, "Everglades Restoration Plan Does Too Little, Experts Say," New York Times (2/22/99): A1. Critics charge Everglades restoration perpetuates human management. Prominent environmental scientists have criticized the \$8 billion plan to restore the Florida Everglades to ecological health as failing to go far enough in re-establishing the natural flow of water in the ecosystem. Instead, they charge the restoration--as currently proposed--would leave the Everglades much as they are now, "a series of disconnected fragments dependent less on natural processes and more on human management involving a complex system of levees, canals, pumps, gates, and reservoirs." Paul Ehrlich, Gary Meffe, Gordon Orians, Peter Raven, E.O. Wilson, and Stuart Pimm are asking that the plan undergo an independent scientific review before it is submitted to Congress for approval in July of 1999. This is the most comprehensive ecological restoration effort ever proposed. It involves recapturing billions of gallons of water now channeled into the Atlantic and gulf, storing some of it in reservoirs and pumping some of it, through wells, into an aquifer. This water would then be pumped out and released when needed through a network of canals, many of them new, to be used by South Florida's growing population and also to mimic the natural flow of water in the Everglades. University of Tennessee ecologist Stuart Pimm argues that this approach at restoration is flawed because it fails to restore natural water flow as much as possible and retains the fragmentation of the Everglades. He believes the philosophy ought to be "natural is better than managed" and he rejects "the notion that the entire system can be managed in perpetuity" by humans. Staff scientists at Everglades National Park have made similar criticism of this high-tech approach at restoration favored by the Army Corp of Engineers. A case where the ecological health and naturalness goals of restoration may be in some tension. For an overview of the Everglades restoration project, see William Stevens "Putting Things Right in the Everglades," NY Times (4/13/99): D1. Also, story in Science 283(1999):1093. (v.10,#1)

Stevens, William K., "Long-Line Fishing Seen as Damaging to Some Fish and to the Albatross," New York Times (11/5/96): B5. Long-line fishing: Almost as bad as drift nets. Drift nets are 30-mile long walls of fine mesh that catch nearly everything that they contact. Drift nets have been banned because of their devastation of marine life. Now technologically sophisticated long-line fishing is also proving to be quite damaging. Typical long-lines are between 20 and 40 miles long, though some stretch to 80 miles. Each of these lines carries thousands of hooks; large ships put out tens of thousands of hooks at once. Some vessels have systems that bait the hooks and remove the catch automatically, and many are outfitted with satellite tracking, sonar, and radar. Thousands of these ships are now roaming the seas. Though more discriminating than drift nets in what they catch, long-liners are being blamed for the deaths of many non-targeted species, including pilot whales, common dolphins, and various surface-feeding sea birds that grab the baited hooks before they sink and then get dragged under water. The most notable of these is the wandering albatross, the largest bird in the world with an eleven-foot wing span. It can fly over 500 miles a day at 50 miles per hour. Other species of albatross are hooked as well, and one study concludes that more than 40,000 are being killed by long-liners each year in the southern Pacific. Scientists are also worried that this high-technology fishing will deplete such target fish populations as tuna, sharks, and swordfish. For example, long-liners are responsible for the decline in Atlantic swordfish, whose numbers are at only 58% of the minimal viable population size. The populations of reproducing adults is only 2-3% of its un-fished size. (v8,#2)

Stevens, William K., "New Evidence Finds This Is Warmest Century in 600 Years," New York Times, April 28, 1998, page B13. Greenhouse gases now seem to be the major influence. (v9,#2)

Steverson, Brian K. "On Norton's Reply to Steverson." Environmental Ethics 19(1997):335-336. (EE)

Steverson, Brian K. "Contextualism and Norton's Convergence Hypothesis." Environmental Ethics 17(1995):135-150. Toward Unity among Environmentalists is Bryan Norton's most developed effort to surmount the frequently intractable debate between anthropocentrists and nonanthropocentrists. Norton argues that the basic axiological differences between the two positions have become irrelevant at the level of policy formation. His thesis is that the two camps converge when dealing with practical goals and aims for environmental management. I argue that Norton's approach falls significantly short of establishing such a convergence because of the overall methodological framework for policy formation that he defends. The key problem with that framework is that it fails to provide for the degree of species protection most suitable to the nonanthropocentrist position. Steverson is in the department of philosophy, Gonzaga University, Spokane, WA. (EE)

Steverson, Brian K., "On the Reconciliation of Anthropocentric and Nonanthropocentric Environmental Ethics," Environmental Values 5(1996):349-361. I argue that James Sterba's recent attempt to show that, despite their foundational axiological differences regarding the relative value of humans and members of nonhuman species, anthropocentrists and nonanthropocentrists would accept the exact same principles of environmental justice fails. The failure to reconcile the two positions is a product of an underestimation of the divergence that occurs at the level of general principles and practical policy as a result of the initial value commitments which characterize each position. The upshot of this is that, contrary to those who argue that environmental ethicists ought to move beyond the traditional anthropocentric-nonanthropocentric debate, the foundational debate about interspecific egalitarianism will continue to issue in substantial debates about environmental policy formation. KEYWORDS: Anthropocentrism, environmental justice, nonanthropocentrism, Sterba (EV)

Steverson, Brian K. "Ecocentrism and Ecological Modeling." Environmental Ethics 16(1994):71-88. Typical of ecocentric approaches such as the land ethic and the deep ecology movement is the use of concepts from ecological science to create an "ecoholistic" ontological foundation from which a strong environmental ethic is generated. Crucial to ecocentric theories is the assumption that ecological science has shown that humanity and nonhuman nature are essentially integrated into communal or communal-like arrangements. I challenge the adequacy of that claim. I argue that for the most part the claim is false, and that if it were true, it would overextend the sphere of morally considerable entities to include entities that are implausibly deserving of moral consideration. In either case, the foundation of ecocentrism is significantly weakened. Steverson is in the philosophy department, Gonzaga University, Spokane, WA. (EE)

Stavis, Dimitris and Assetto, Valerie J., eds., The International Economy of the Environment: Critical Perspectives. (International Political Economy Yearbook, volume 12). Boulder, CO and London: Lynne Rienner Publisher, 2002. Fourteen contributors who believe that environmental problems are real, serious, and need to be solved. Environmental managerialism is often a servant of capital; there is much 'capture' of the environmental agenda by business. The authors seek to harness the power of political theory and the governance of the state to find solutions for environmental crises. Case studies of how societies respond to an idea become fashionable that may threaten their survival, status, or credibility, or offer new opportunities, such as for public subsidies and influence. The editors are in political science, Colorado State University.

Stewart, Frank, A Natural History of Nature Writing. Shearwater/Island Press, 1995. Cloth, \$32.50; paper, \$16.95. From Thoreau to Ed Abbey, nature writing has profoundly influenced American literature. (v6,#2)

Stewart, Robert Scott and Nicholls, Roderick, "Virtual worlds, travel, and the picturesque garden," Philosophy and Geography 5 (No. 1, 2002): 83-99. Debate concerning virtual reality is often drawn in terms of sharply defined dichotomies – for example, between "real" (or "actual") and "virtual," "authentic" and "inauthentic," and "natural" and "artificial." In this paper we offer an alternative approach by suggesting a conception of a virtual world that highlights a continuity and commonality with our sense of everyday reality. We accomplish this in part by an examination of the English picturesque garden as if it were a virtual world partially constructed out of ideas and objects collected during travels to foreign lands on the Grand Tour. Such foreign travel transformed not only the English person's sense of self, but also altered the English landscape. We conclude that in one sense the "real" England" is also a "virtual" reality. Stewart is an Associate Professor of Philosophy at the University College of Cape Breton. Nicholls is an Associate Professor of Philosophy at the University College of Cape Breton. (P&G)

Stewart, Susan, "Response to Brady, Phillips and Rolston," Environmental Values 15(2006): 315-320. A

response to conference papers by Brady, Phillips, and Rolston on aesthetics and environmentalism, this essay argues that sound environmental policy might begin with basic questions about the purpose and extent of human life, for such policies shape human nature as they also shape the phenomenal world. Decisions based upon short-lived economic conditions cannot provide those long-term benefits necessary for the preservation of the environment. Aesthetic judgments, because they are reflective, help us anthropomorphise ourselves; along with scientific judgments, they might serve as foundational, rather than auxiliary, practices for determining the future of our finite planet. (EV)

Stewart Wayne, Metaphysics by Default. A website book publication. Juxtaposes metaphysicians and naturalists, often thought to be at odds with one another, to create a dialogue between them, and even a peaceful co-existence. Nineteen chapters. Website address: <http://mbdefault.org/> (v10,#4)

Stewart, Wayne, Metaphysics by Default, an electronic publication at: <http://mbdefault.org> Can metaphysical philosophy be reconciled to naturalism? The author argues that it can. The challenge of the reconciliation is shown to lie in finding naturalistic foundations for metaphysical concepts. This paper focuses upon personal identity--first analyzing the known naturalistic criteria of personal identity; then interpreting the metaphysics which emerges from that analysis. An initial, qualitative metaphysics is discussed and defended. Thereafter, the author quantifies several aggregate metaphysical results. Along the way, a historical precedent is reconstructed from the Arabic writings of Fatimid Hellenists. At the end, the author sets forward potential benefits: contemporary ethical and ecological difficulties are seen to be resolved within the context of this new metaphysics. Stewart can be reached at e-mail: WayneStewart@email.msn.com

Stich, Stephen P., "Do Animals Have Beliefs?", Australasian Journal of Philosophy, 57 (1979): 15-28. (Abstract based on abstract in Philosopher's Index) On the one hand, it seems plausible that higher animals' behaviour can be explained by a belief-desire theory in just the same way as human behaviour is explained; on the other hand, it seems impossible to say just what it is that an animal believes. Stich's thesis is that the title question is moot. It is argued that the intuitive concept of belief is a hybrid one. To be a belief a psychological state must have certain functional or causal properties and it must have an expressible content. What is more, having a content requires having a body of beliefs similar to ours. Animals may well have psychological states whose functional characteristics qualify them as beliefs, but which have no expressible content.

Stiglitz, Joseph E., Globalization and Its Discontents. New York: Norton, 2002. Although not opposed to globalization per se, economist and Nobel laureate Stiglitz offers a trenchant polemic against the type of globalization promoted by the U.S. and world financial institutions--a type he says is neither fair nor efficient and is often detrimental to poorer countries. He concludes by outlining steps toward "a globalization with a more human face."

"I have written this book because while I was at the World Bank, I saw firsthand the devastating effect that globalization can have on developing countries, and especially the poor within those countries. ... Especially at the International Monetary Fund ... decisions were made on the basis of what seemed a curious blend of ideology and bad economics, dogmas that sometimes seemed to be thinly veiling special interests ... The IMF's policies, in part based on the outworn presumption that markets, by themselves, lead to efficient outcomes, failed to allow for desirable government interventions in the market, measures which can guide economic growth and make everyone better off" (p, ix, p. xiii, p. xii). Stiglitz was on the Council of Economic Advisors under U.S. President Bill Clinton, and then Chief Economist for the World Bank. (v.13,#4)

Stokstad, Eric, "What's Wrong With the Endangered Species Act?" Science 309(30 September 2005):2150-2152. Mainly the claim that it has not worked very well, owing to growing backlog of candidate species and lack of effective designation of critical habitat, with much of the slow-down from lack of funding owing to congressional lack of support, owing in turn to pressures from developers.

Stokstad, Eric, "States Sue Over Global Warming," Science 305(30 July, 2004):590. See also New York Times, "A Novel Tactic on Warming," July 28, 2004, A 18. Where the Bush Administration fails to act, seven states--California, Connecticut, Iowa, New Jersey, New York, Rhode Island, Vermont--and New York City have filed suit against five of the country's largest power companies, to force them to reduce carbon dioxide emissions. Their claim is that the utility companies release pollutants that harm their residents. But under public-nuisance law, to win the states will have to show that their citizens are harmed more than citizens of other states, which could be tough to do, considering how much the pollutants move around. (v. 15, # 3)

Stokstad, Erik, "University Bids to Salvage Reputation after Flap over Logging Paper," Science 312 (2 June 2006): 1288. Oregon State University College of Forestry continues to show deep divisions in the faculty after the furor over attempting to suppress publication of a paper in Science by graduate student Dan Donato and colleagues on the adverse ecological effects of salvage logging. Subpoenaed e-mails from Dean Hal Salwasser express contempt for environmental activists calling them "goons" and comparing their protests to Mafia extortionists. Salwasser says he now regrets those e-mails which he calls "stupid, unthinking, unkind." The faculty reveals deep tensions over management to increase harvests and spur regeneration after fires and an emphasis on biodiversity conservation, as well as misgivings over industry pressures and academic freedom.

Stokstad, Erik, "House Revises Endangered Species Act," Science 310(7 October 2005):32. The U.S. House passed a revised Endangered Species Act, hustled through the House Resources Committee in just four days by Richard Pombo, longtime critic of the Act and chair of that committee. The bill passed the

House 229-193. The revised Act eliminates critical habitat provisions, requires that FWS evaluate proposals in 180 days or else proposals get an automatic green light, and that if land is preserved unaltered for species protection, the U.S. Fish and Wildlife Service must compensate owners, without providing any additional money to do so. The U.S. Senate is unlikely to work on a companion bill until spring 2006, and likely to make more moderate changes to the Act.

Stokstad, Erik, "Humane Science Finds Sharper and Kinder Tools," *Science* 286(5 November 1999):1068-1071. New technology is helping researchers reduce their reliance on animal experiments, while at the same time improving their results. "Humane science is better science," was a frequent conclusion at the Third World Congress on Alternatives and Animal Use in the Life Sciences. Use of animals in the U.K. has declined nearly 50% (from over 5 million a year in the seventies to about 2.5 million a year), although use of transgenic animals is up sharply in this decade from 50,000 to 450,000. A major feature is implantable chips. But government regulatory agencies are slow to accept these results. (v10,#4)

Stokstad, Erik, "Debate Continues Over Safety of Water Spiked with Rocket Fuel," *Science* 307(28 January 2005):507. Drinking water in a hundred or more locations around the United States is contaminated with perchlorate, used in rocket fuel and explosives. With enough dose, damage to the thyroid gland and to the developing brain results. But what is a safe dose, one part per billion or 220 parts per billion. The Environmental Protection Agency and a study group of the National Academy of Sciences disagree, by orders of magnitude. A recent NAS panel takes a conservative view but industry says precaution is trumping science. Precautionary principle?

Stokstad, Erik, "Louisiana's Wetlands Struggle for Survival," *Science* 310(25 November 2005):1264-1266. More than 600 square kilometers of wetlands in the area have disappeared in the last decade along. After hurricanes Katrina and Rita, and a new appreciation of the role of wetlands in flood prevention, ecologists hope their large-scale plants will be implemented. The past 40 years wetlands decline have increased storm surges 2.4-3 meters, although it is not likely that wetland restoration would have been enough to reduce the Katrina storm surge enough to prevent breaching the dikes. Another problem is that now such wetlands have to be artificially maintained, which is fragile and expensive.

Stokstad, Erik, "'Genetic Rescue' Helps Panthers but Puts Researchers on the Spot," *Science* 309(19 August 2005):1162. In 1995 researchers transplanted eight female panthers from Texas to south Florida in a last-ditch effort to reverse the troubling effects of inbreeding in the small population of surviving Florida cats. Stuart Pimm and a team of biologists have analyzed a decade of data (54 offspring from the eight females, mating with Florida males; 118 offspring from purebred Florida kittens) and conclude that the survival rate of the "hybrid" offspring is three times greater, especially for females. But some Florida Fish and Wildlife Conservation Commission researchers complain that the analysis is premature.

Stokstad, Erik. "Feared Quagga Mussel Turns Up in Western United States." *Science* Vol. 315, no. 5811 (26 January 2007): 453. Close relative of the zebra mussel that has tormented the Great Lakes has been found in Lake Meade and below in the Colorado River.

Stokstad, Erik. "Big Land Purchase Triggers Review of Plans to Restore Everglades." *Science* Vol. 321, no. 5885 (4 July 2008): 22. A major land deal in Florida, buying out US Sugar Corporation, the largest sugar cane producer in the state, offers new opportunities for regulating water flow through the Everglades.

Stokstad, Erik. "Deadly Wheat Fungus Threatens World's Breadbaskets." *Science* Vol. 315, no. 5820 (30 March 2007): 1786-87. New mutations have resulted in the devastating spread of a killer wheat fungus. Causing black stem rust, the fungus destroyed wheat crops in the 1950s, but resistant wheat varieties were

found during the Green Revolution. Now that the fungus is back, new varieties that attack previously resistant wheat have appeared in Uganda and Ethiopia and are rapidly spreading into the Middle East, from whence they may spread to Asia.

Stolzenburg, William, "Sweet Home Alabama," Nature Conservancy 47(no. 4, Sept./Oct 1997):8-9. Alabama a biodiversity hotspot? Well, yes. The 29th largest of the United States, Alabama is the nation's fourth richest kingdom of plants and animals. In species per square mile only Florida can match it. Part of the reason is the wide ranging topography, from sea level to the Southern Appalachians, which coincides with a reach from almost subtropical to mountain temperate forests. But, alas, Alabama's number of extinct or mission species towers above all other states in the lower 48. Some 98 species have gone extinct. See also Lydeard, Charles and Mayden, Richard L., "A Diverse and Endangered Aquatic Ecosystem of the Southeast United States," Conservation Biology 9(1995):800-805. (v9,#1)

Stone, Alison, Review of de Jonge, Eddy, *Spinoza and Deep Ecology: Challenging Traditional Approaches to Environmentalism*. Aldershot: Ashgate, 2004. Environmental Values 14(2005):524-527.

Stone, Alison, "Introduction: Nature, Environmental Ethics, and Continental Philosophy," Environmental Values 14(2005):285-294. Until recently, there has been relatively little self-conscious reflection - from either environmental or continental philosophers - on the specific contributions which continental philosophy, insofar as it is a distinctive tradition, might make to environmental thought. This situation has begun to change with several recent publications, such as Charles S. Brown and Ted Toadvine's (2003) edited collection *Ecophenomenology: Back to the Earth Itself*, and Bruce V. Foltz and Robert Frodeman's (2004) collection *Rethinking Nature: Essays in Environmental Philosophy*. This special issue aims to continue the discussion of how the continental tradition might advance or transform environmental thinking, both by reconsidering authors such as Kant, Schelling, Nietzsche and Heidegger, and by considering how themes and concepts from continental philosophy and social theory - including Merleau-Ponty's concept of flesh, Foucault's notion of discipline, and Bourdieu's social critique of taste - bear on environmental practice and theory. Stone is at the Centre for Philosophy, Furness College, Lancaster University, Lancaster, UK. (EV)

Stone, Christopher D. "Moral Pluralism and the Course of Environmental Ethics." Environmental Ethics 10(1988):139-54. Environmental ethics has reached a certain level of maturity; further significant advances require reexamining its status within the larger realm of moral philosophy. It could aim to

extend to nonhumans one of the familiar sets of principles subject to appropriate modifications; or it could seek to break away and put forward its own paradigm or paradigms. Selecting the proper course requires as the most immediate mission exploring the formal requirements of an ethical system. In general, are there constraints against bringing our moral relations with different sorts of things under different rules of governance? In particular, how much independence can an environmental ethic (or ethics) aim to have? For replies, see: Callicott, J. Baird. "The Case against Moral Pluralism." Environmental Ethics 12(1990):99-124; Wenz, Peter. "Minimal, Moderate, and Extreme Moral Pluralism." Environmental Ethics 15(1993):61-74; Varner, Gary E. "No Holism without Pluralism." Environmental Ethics 13(1991):175-79. Stone is at the School of Law, University of Southern California, Los Angeles, CA. (EE)

Stone, Christopher D., "Should Trees Have Standing? Revisited: How Far Will Law and Morals Reach? A Pluralist Perspective." Southern California Law Review 59 (1985): 1-154. Stone returns to the scene of his pioneering article on the legal rights of nature, now with the luxury of developing a full-scale argument for a position he terms "Moral Pluralism": "moral activities [are to be] partitioned into several distinct domains, each governed by distinct principles and logical texture" (p. 9). Stone focuses on the toughest possible test case for environmental ethics: can we ascribe "legal consideration" to entities he calls Ds--disinterested entities, i.e., entities without any sentience at all. He argues that legal consideration is not a problem from a logical point of view; but the question remains whether it is a rational, wise, or moral policy to undertake. To answer this question we require a moral theory that can take account of Ds, and this he thinks is moral pluralism: treating different entities differently, for they are located on different moral planes. This is a complex and important paper. The challenge to Stone's moral pluralism is its tendency to degenerate into a kind of relativistic intuitionism. (Katz, Bibl # 1)

Stone, Christopher D., "Moral Pluralism and the Course of Environmental Ethics," Environmental Ethics 10(1988):139-154. This is a precis of Stone's book, Earth and Other Ethics: The Case for Moral Pluralism. Stone argues that we should give up the attempt to develop a "moral monism," i.e., one guiding moral principle that is applicable in all situations, with all kinds of human, animal, and natural entities. But pluralism implies the ultimate indeterminacy of ethical systems and judgments. (Katz, Bibl # 2)

Stone, Jerome A. Review of The Paradise of God: Renewing Religion in an Ecological Age. By Norman Wirzba. Environmental Ethics 27 (2005):207-208.

Stone, Jerome A. "Broadening Care, Discerning Worth: The Environmental Contributions of Minimalist Religious Naturalism." Process Studies 22 (no. 4, Winter 1993):194-203. Religious naturalism, in conjunction with the theory and practice of appreciative awareness such as outlined by Bernard Meland, can contribute to extending our moral concern toward the environment as well as aesthetically appreciating it. In addition, a minimalist religious naturalism with a pluralistic emphasis and a prophetic principle can provide a helpful sense of the plurality of values and a critical readiness to undergo paradigm shifts, both of which are needed in facing our ever-growing eco-crisis. Stone teaches philosophy and religion at William Rainey Harper College, Palatine, IL. (v6,#3)

Legacy 2000 is a five year \$ 200 million initiative to save Hawaii's biodiversity, the most threatened in the U.S. Advocates note that the U.S. is spending billions to save the Everglades, and neglecting Hawaii. (v. 10, # 3).

Stone, Richard, "Caspian Sea Ecology Teeters on the Brink," *Science* 295(18 January 2002):430-433. As nations around the world's largest lake bicker over oil rights, the wildlife of the Caspian Sea is in a state of siege from which it may never recover. Hardest hit are four major species of sturgeon, supplying 90% of the world's caviar, a lucrative commodity, and drastically overfished. Petroleum is naturally so close to the surface that nature does some polluting of its own. Nations around the lake want the oil, but the oil is also considered a major prize by Western powers. With no international effort to safeguard the lake anywhere in sight, the lake itself seem doomed to suffer. (v.13,#1)

Stone, Richard, and Hawk Jia. "Going Against the Flow." *Science* Vol. 313, no. 5790 (25 August 2006): 1034-37. The Chinese government has begun a massive engineering project to divert water from three southern rivers to the parched north a controversial scheme for rearranging nature moving river flows over 1,000 kilometers with unknown consequences.

Stone, Richard. "Can Palm Oil Plantations Come Clean?" *Science* Vol. 317, no. 5844 (14 September 2007): 1491. Palm oil has recently surpassed soybean as the top-selling vegetable oil in the world and has become Malaysia's number one crop. But a just-completed review by three dozen academics details species declines pinned on the oil palm, a native of Africa that has now become a dominant feature of Southeast Asia's landscape. Some scientists and like-minded industry people hope to cut the destruction of wildlife with better palm oil plantation practices.

Stone, Roger D., The Nature of Development: A Report from the Rural Tropics on the Quest for Sustainable Economic Growth. New York: Alfred A. Knopf, 1992. 286 pp. \$ 23. Planning has been from the top-down by the World Bank and International Monetary Fund and largely unsuccessful. Planning ought rather to be from the bottom-up, especially as third world peoples become increasingly skilled at ecological research and strategy and ever more adept at communicating their needs and opinions. Still, a major obstacle is the "excruciating difficult of accomplishing anything in rural work." Stone is a senior fellow at the World Wildlife Fund. (v3,#3)

Stonehouse, D. Peter, "A New Modus Operandi For the Agricultural Economics Profession," *Journal of Agricultural and Environmental Ethics* 10(1997):55-67. Agricultural economics has, until the 1990s,

enjoyed a reputation for relevance and usefulness to the agri-food industry and policy-makers. That reputation has been jeopardized by a growing infatuation with models and quantification, and a concomitant underemphasis placed on many complex problems and issues of society. An illustrative example is explored, using agricultural activity-related damage to the natural resource base, environment and ecology. Agricultural economists are urged to respond by broadening their terms of reference and joining forces with other disciplines. (JAEE)

Stoneman, Colin, "Spiritual Biology," Journal of Biological Education 31 (no. 2, Summer 1997):131-134. What should biology teachers do where there is an interest in education for spiritual development? The UK government Office for Standards in Education has long held that education should contribute to pupil's moral, spiritual, and social development, but more recently, since 1992 as a consequence of the Education (Schools) Act of 1992, has urged that all subjects of the curriculum contribute to this development, including biological science. Biology does not deal with "spirit"; some think that the success of biology requires chasing out the spirits; and yet biologists do not want the reputation of being indifferent toward their pupils whole and well rounded development. The guidelines say: "Spiritual development refers to that aspect of inner life through which pupils acquire insights into their personal existence which are of enduring worth [including] valuing a non-material dimension to life and intimations of an enduring reality." There are better and worse ways of interpreting what this might mean for biology. Might it involve caring for creation and environmental responsibility for example? Or the deeper questions of human existence, such as the mind-body problem, the human relation to nature, or ethics and biology? In any case, (British) biologists have a challenge. Stoneman is a retired biology teacher. (v8,#3)

Story Earth: Native Voices on the Environment. San Francisco, CA: Mercury House, 1993. First published in the Netherlands as Het verhaal Aarde by In de Knipsheer Publishers for Bridges Books, Amsterdam, 1992. No editor is named. 200 pages. Stories from indigenous peoples, and by indigenous authors, on six continents, from Australia, Brazil, Canada, Easter Island, Egypt, Finland, Guatemala, India, Kenya, Lesotho, Nepal, Papua New Guinea, Peru, Philippines, Solomon Islands, Sri Lanka, and the United States. The nature of the global crisis and changes we must make in the way we view the world. Only by turning away from the industrial view of the Earth as a resource to be consumed, and only by listening to the lessons of traditional cultures that have for centuries maintained a sustainable relationship to the Earth can we cure the damage that Western civilization has wrought. Originally published with a subsidy from the Dutch Environment Ministry. (v8,#2)

Straede, Steffen, and Finn Helles, "Park-People Conflict Resolution in Royal Chitwan National Park, Nepal: Buying Time at High Cost," Environmental Conservation 27(no.4, Dec. 2001): 368-. (v.12,#3)

Straede, Steffen, and Helles, Finn, "Park-people Conflict Resolution in Royal Chitwan National Park, Nepal: Buying Time at High Cost?" Environmental Conservation 27 (no. 4, 2000):368-381. Royal Chitwan National Park, Nepal, is a major tiger and rhino sanctuary, also a dozen other charismatic

species, located in lowland Nepal (the Terai), and surrounded by an exploding, impoverished human population. Local peoples have been permitted to cut grasses, mostly for thatch, in the park ten days a year; they also take much fuelwood without penalty, though this is officially illegal. The authors present survey data and argue that forest conservation is being compromised, habitat being degraded, and that, whether one is concerned for the tigers and rhinos or not, even the grass cutting program is not sustainable. The deeper problems are only being postponed. They recommend some possible changes for the better. The authors are in forestry and natural resource economics, Royal Veterinary and Agricultural University, Denmark. (v.12,#3)

Strahan, Ronald, ed. Mammals of Australia. Washington, D.C.: Smithsonian Institution Press, 1996. 756pp. \$75 cloth. Written by more than one hundred experts, this book surveys the rich and varied world of Australian mammals, describing every species known to have existed in the last two hundred years. It includes well known mammals, as well as the less known. It has reference documents for each species' habitat, diet, reproduction, and growth as well as patterns of activity such as feeding, sheltering, attack and defense, social interactions, courtship, mating, and care of the young. The conservation status of each species and the effect of human settlement on its population are included.

Streiffer, Robert, and Thomas Hedemann, "The Political Import of Intrinsic Objections to Genetically Engineered Food," Journal of Agricultural and Environmental Ethics 18(2005):191-210. Many people object to genetically engineered (GE) food because they believe that it is unnatural or that its creation amounts to playing God. These objections are often referred to as intrinsic objections, and they have been widely criticized in the agricultural bioethics literature as being unsound, incompatible with modern science, religious, inchoate, and based on emotion instead of reason. Many also argue that even if these objections did have some merit as ethical objections, their quasi-religious nature means that they are entirely irrelevant when interpreted as political objections. We argue that this widespread view is false. Intrinsic objections have much more political import than has previously been recognized. Keywords ethics - genetically engineered food - genetically modified food - GM food - intrinsic objections - liberal neutrality - playing God - political liberalism - unnaturalness - yuck factor. The authors are in philosophy, medical history, and bioethics, University of Wisconsin, Madison, WI. (JAEE)

Stricklin, W. Ray and Swanson, Janice C., "Technology and Animal Agriculture", Journal of Agricultural and Environmental Ethics 6(1993). Technology can be defined as the manipulation of nature to serve human needs and interests. Food and fibre producing animals were domesticated through an alteration of their gene pools by humans to serve human interests. Thus, we present an argument that the domestication and use of animals in animal agriculture is a technology. During the initial stages of domestication, the relationship was possibly one of symbiosis between humans and animals, but humans now have control over animals through the application of technology. Recently, new techniques in molecular genetics (biotechnology) have presented the possibility of rapid and radical changes in animal genotypes and the production of compounds such as biologically engineered growth enhancers. The application of other technologies, especially those related to the control or eradication of contagious diseases, permitted the development of intensive confinement animal agriculture. These production systems typically involve large numbers of animals managed in one housing unit, sometimes as one group. Animals in these confinement systems are less diseased, grow faster and more efficiently, but live in structures that limit their freedom of movement and control their social environment. The modern confinement production systems that employ recent advances in technology have been characterized by some as biologically inefficient, harmful to the environment, harmful to human health and bioethically unjustifiable because of restrictions on the animal's behaviour and activity. Some persons have proposed that all technology has a negative impact on animal welfare. The term "factory farming" is now a phrase

that implies the harmful impact of technology on animal well-being. We contend that some technologies have actually enhanced animal welfare, and extend this idea to suggest that control over nature does not have to equate to negative animal well-being. A challenge for animal agriculturalists is to design food production systems that provide an appropriate quality of life for animals, are efficient and sustainable in the utilization of resources and are compatible with the social and economic interests of the general and agricultural public. Stricklin and Swanson are in the Department of Animal Sciences, University of Maryland, College Park, MD 20742.

Stricklin, W. Ray, and Joy A. Mench, eds., "An International Conference on Farm Animal Welfare: Ethical, Scientific and Technological Perspectives." An International Conference on Farm Animal Welfare was held at Queenstown, Maryland in June 1991. The reviewed proceedings from the conference are included in two issues of the Journal of Agricultural and Environmental Ethics, volume 6. The conference dealt with ethical, scientific and technological perspectives on animal welfare. Accordingly, persons from university, government, animal industries and animal protection organizations participated in the conference. The major financial sponsors were the National Science Foundation and the Geraldine Dodge Foundation. A primary objective of the conference was to establish dialogue on the topic of farm animal welfare that would serve as the basis for formulating general research directions.

Stridbeck, Bolof. Ekosofi och Etik. Göteborg, Sweden: Bokskogen, 1994. ISBN 91 7776 070 0. A doctoral dissertation in practical philosophy delivered to the Humanities faculty at the University of Gothenburg, Sweden, in June 1993. With an English summary, pp. 289-299. Chapter 1. Ecological balance as homeorhetic balance, balance in a system that maintains the same direction of change. Chapters 2-5 follow an analogy with the Noble Truths of Buddhism, and feature selected Norwegian and other ecophilosophers. Chapter 2. The truth of suffering. How bad is it today? Sigmund Kvaloy (Sätereng). Chapter 3. The truth of the cause of suffering. Why is it like this? Hjalmar Hegge. Chapter 4: The truth of the end of suffering. How should it be instead? Arne Naess and Henryk Skolimowski. Generally he finds that these thinkers complement one another. Chapter 5. The truth of the way to the end of suffering. Thomas Mathiesen, and his political strategy for promoting "ecological balance and creative manifoldness." Stridbeck also concludes "No concrete entities other than experiences have intrinsic value."

Strong, David. Crazy Mountains: Learning from Wilderness to Weigh Technology. Albany: State University of New York Press, 1995. 253 pages. \$ 14.95 paper. Strong uses the Crazy Mountains of Montana, a wilderness, jeopardized by a newly bulldozed road and a planned timber sale to trigger a series of wide-ranging reflections on the way in which technology is transforming the Earth in increasingly extensive ways. From wilderness we can learn what things are real and how this reality can re-order our lives. Written with considerable literary power and philosophical clarity. Strong teaches philosophy at Rocky Mountain College, Billings, Montana. (v6,#3)

Strong, David. "Disclosive Discourse, Ecology, and Technology." Environmental Ethics 16(1994):89-102. Currently, much hope for the protection of nature is pinned on the science of ecology. Without suggesting that we should pay less serious attention to science, I argue for a more pluralistic approach to the environmental and technological problems facing our time. I maintain that when ecology changes attitudes and ways of life, it does so by importing a language of engagement with nature rather than by remaining confined to a strictly scientific account. This language of engagement, which shows how nature and natural things can be engaged by humans in a multiplicity of ways, I call disclosive discourse. Disclosive discourse, however, is not used exclusively by ecologists and other scientists. To the contrary, the great literary writers exemplify in their writings the ways this discourse can present nature and natural things in their most profound and powerful appeal. Moreover, disclosive discourse is not limited to words: artworks, too, are disclosive. By characterizing the deeper problem with which we are faced differently, as fundamentally technological rather than environmental, a more diversified plurality of alternatives to technology, not limited to those having to do with primarily nature, can be brought into relief and encouraged. Strong is in the department of philosophy, Rocky Mountain College, Billings, MN. (EE)

Strudler, Alan, "Valuing Nature: Assessing Damages for Oil Spills," Report from the Institute for Philosophy and Public Policy 15 no. 1 (Winter, 1995): 6-10. The Valdez spill reviewed. Determining dollar amounts commensurate with nonuse values has proved elusive. But one should not conclude that any dollar amount imposed by a court is arbitrary and unfair. Arbitrariness can be limited by judges who review damage awards for their consistency with comparable cases. Accidents themselves are deeply arbitrary, and, in the case of oil spills, there is no reason that the weight of the arbitrary should fall

entirely on the shoulders of the public. By imposing liability for lost nonuse values on firms like the Exxon corporation, the burden of arbitrariness is more fairly shared. Strundler is a Research Scholar at the Institute for Philosophy and Public Policy, University of Maryland. (v6,#2)

Stuart, Chris, Stuart, Tilde. Africa's Vanishing Wildlife. Washington, D.C.: Smithsonian Institution Press, 1996. 208 pp. \$39.95 cloth. Drawing on data from IUCN publications, this work documents the perils of Africa's vulnerable, rare, and declining species. Pinpointing both keystone species --such as the African elephant--and those that are little known, the authors cover primates, carnivores, antelopes, birds, reptiles, amphibians and freshwater fish. Synthesizing the biology, natural history, and conservation status of Africa's vanishing species, this is an accessible review of the continent's wildlife. (v7,#4)

Stuart, Nicole, "Technology and Epistemology: Environmental Mentalities and Urban Water Usage," *Environmental Values* 16(2007): 417-431. This paper examines the mentalities associated with the transformation of 'nature' into urban life in industrial societies, with particular reference to the conversion of rainwater into tap water. It argues that industrial technologies dissociate urban dwellers from the natural environment upon which they depend. The paper maintains that this dissociation has contributed to mentalities encouraging the depletion and degradation of water resources and critically examines technological strategies for managing urban water use. The paper argues that epistemological systems must be reformed in conjunction with changing technological systems before environmental management strategies are likely to succeed. It concludes by suggesting ways in which urban water provision could be transformed so as to encourage greater ecological awareness and activism. Stuart is in the School of Earth and Geographical Sciences, University of Western Australia, Crawley.

Stuart, Simon N., et al (6 others), "Status and Trends of Amphibian Declines and Extinctions Worldwide," *Science* 306(3 December 2004):1783-1786. A global census shows that most of the 5,743 known amphibian species are in decline and one-third are currently endangered. Amphibians are more threatened and are declining more rapidly than either birds or mammals. Although many declines are due to habitat loss, other, unidentified processes are driving species quite quickly to extinction. The lead author (and several of others) are with the IUCN Species Survival Commission/Conservation International Center for Applied Biodiversity Science, Biodiversity Assessment Unit, Washington, DC.

Stuart, Tilde, Stuart, Chris. Africa's Vanishing Wildlife. Washington, D.C.: Smithsonian Institution Press, 1996. 208 pp. \$39.95. Sturm, Matthew et al., "Winter Biological Processes Could Help Convert Arctic Tundra to Shrubland", BioScience 55(no.1, January 2005):17-26(10). In arctic Alaska, air temperatures have warmed 0.5 degrees Celsius (C) per decade for the past 30 years, with most of the warming coming in winter. Over the same period, shrub abundance has increased, perhaps a harbinger of a conversion of tundra to shrubland. Evidence suggests that winter biological processes are contributing to this conversion through a positive feedback that involves the snow-holding capacity of shrubs, the insulating properties of snow, a soil layer that has a high water content because it overlies nearly impermeable permafrost, and hardy microbes that can maintain metabolic activity at temperatures of -6C or lower. Increasing shrub abundance leads to deeper snow, which promotes higher winter soil temperatures, greater microbial activity, and more plant-available nitrogen. High levels of soil nitrogen favor shrub growth the following summer. With climate models predicting continued warming, large areas of tundra could become converted to shrubland, with winter processes like those described here possibly playing a critical role.

Sullivan, Shannon, McCann, Elizabeth, DeYoung, Raymond, Erickson, Donna. "Farmers' Attitudes about Farming and the Environment: A Survey of Conventional and Organic Farmers," Journal of Agricultural and Environmental Ethics 9(1996):123-143. This paper compares the attitudes and beliefs of a group of conventional farmers to those of a group of organic farmers. It was found that while both groups reject the idea that a farmer's role is to conquer nature, organic farmers were significantly more supportive of the notion that humans should live in harmony with nature. Organic farmers also reported a greater awareness of and appreciation for nature in their relationship with the land. Both groups view independence as a main benefit of farming and a lack of financial reward as its main drawback. Overall, conventional farmers report more stress in their lives although they also view themselves in a caretaker role for the land more than do the organic farmers. In contrast, organic farmers report more satisfaction with their lives, a greater concern of living ethically and a stronger perception of community. Both groups are willing to have their rights limited (organic farmers somewhat more so) but they do not trust the government to do so. Keywords: environmental attitudes, organic farming environmental ethics. Sullivan, DeYoung and Erickson teach in the School of Natural Resources and Environment, University of Michigan. McCann teaches in the College of Natural Resources, University of Wisconsin Stevens Point. (JAEE)

Sumner, David, Review of Michel B. Gerrard, Whose Backyard, Whose Risk: Fear and Fairness in Toxic and Nuclear Waste Siting. Environmental Values 7(1998):122.

Sumner, David, and Gilmoura, Peter. "Radiation Protection and Moral Theory." Environmental Values 4(1995):241-255. It seems likely that there is no threshold for the induction of cancer by ionising radiation. Hence even small radiation doses may result in a finite number of premature deaths if a large number of people are exposed. Various arguments are used to demonstrate that such deaths, if they occur, are acceptable; these arguments are shown to be flawed. Many of the arguments, and the ICRP's principle of justification, appear rooted in a utilitarian system of moral philosophy. Such a system is superficially attractive as it appears objective and rational; however, the objectivity may be an illusion masking the underlying aims of the interested parties. KEYWORDS: Radioactive discharges, utilitarianism, emotivism, justification, cost-benefit analysis. Sumner resides at Whithorn, UK. Gilmoura resides at Glasgow. (EV)

Sumner, L. W. Review of The Ethics of Environmental Concern. By Robin Attfield. Environmental Ethics 8(1986):77-82.

Sumner, L. W., Donald Callen, and Thomas Attig, eds., Values and Moral Standing. Bowling Green: Applied Philosophy Program, Bowling Green State University, 1986. Pp. iii, 167. This is the eighth

volume in a series of conference papers on various subjects in applied philosophy. All the 1986 papers concern questions of moral standing: what kind of entities deserve moral consideration, and why? All the papers are tangentially related to environmental issues, but only three discuss environmental ethics directly. Anthony Weston, "Towards an Inclusive Ethics," continues his defense of a theory of pragmatic value--a Deweyan holism which transcends the person-centered model of moral value and recognizes the moral value of nonhuman entities (see also his article in Environmental Ethics, 1985). Eric Katz, "Buffalo-killing and the Valuation of Species" (pp. 114-123), examines the two main schools of non-anthropocentric environmental ethics, individualism and holism, and argues that each is appropriate at certain times--neither view is comprehensive. Holmes Rolston, "The Human Standing in Nature: Fitness in the Moral Overseer" (pp. 90-101), discusses the proper place of humanity in the comprehension of, or interaction with, nature. Although man transcends nature because he can have a global objective world view, the challenge implied by the view is to "learn interspecific altruism." The value in nature for man is "storied achievement:" the unity of history with natural ecological development. "Humans want a storied residence in nature where the passage of time integrates past, present, and future in a meaningful career" (p. 99). (Katz, Bibl # 1)

Sunquist, Fiona, "End of the Ark? International Wildlife 25 (no. 6, Nov./Dec. 1995):22-29. Captive breeding is out; conservation in the wild is in. Facing increasing disapproval of keeping animals in the captivity, Michael Hutchins, Director for conservation and science at the American Zoo and Aquarium Association, says: "The zoo profession is at an important crossroads in its history. The world is changing around us, and if we choose to conduct business as usual, we are not sure that zoos will ultimately survive. ... As zoos struggle to define what they are supposed to be and do, they're finding an ever-greater role in saving animals in the wild." William Conway, director of what was once the Bronx Zoo (now a "Conservation Park," says, "I don't believe there is any question but that every accredited North American zoo will have a significant field conservation effort within six years." At present, the budget for one good U.S. zoo can equal the entire budgets of all the national wildlife conservation agencies in countries south of the Sahara in Africa.

Sunstein, Cass R., Risk and Reason: Safety, Law, and the Environment. New York: Cambridge University Press, 2002. A wide-ranging analysis of the problem of managing environmental health risks (and not much further attention to ecosystem health, or nature conservation). From the 1970's the U.S. Congress was inclined to "command and control" regulation, often silent on cost-benefit balancing, sometimes even precluding it. On the whole these laws led to major environmental and health

improvements that justify the high visible costs they often entailed. But some, especially cleaning up waste sites, cost too much with too little benefit.

Regulatory reforms are now needed. Agencies need to conduct a quantitative assessment of risks before developing regulations, and not to rely either on qualitative impressions or on public perceptions, which are often wrong. Reforms need to consider tradeoffs, and to express both costs and benefits, often in monetary terms. An appropriate value for a human life is in the range of \$ 5 million to \$ 8 million. Reforms need to go beyond "command and control" to use economic incentives, encourage self-disclosure, allow trading of pollution permits. But cost-benefit analysis does have its limits, especially when scientific uncertainty is great (as with arsenic in drinking water). Sunstein defends what he calls "a highly technocratic approach to risk regulation." Conservatives are likely to regard Sunstein's proposals as self-evident; environmentalists will have their doubts. Sunstein is in law, University of Chicago Law School.

Sutherland, Anne and Jeffrey E. Nash. "Animal Rights as a New Environmental Cosmology." Qualitative Sociology 17 (no. 2, 1994): 171-186. The secularization and modernization of society have created opportunities for broad interpretations of fundamental questions of life. The Animal Rights Movement challenges Judeo-Christian cosmology and offers an alternative. It redefines the distinctions between humans and animals and gives them a new meaning within the generalized environmental other. As an emerging cosmology, it functions to give believers a means of dealing with questions of order and chaos, suffering, good and evil, and justice. It also creates a community of people who seek redemption through saving animals. The animal rights movement goes beyond moral protest and takes on the role of a religious cosmology. Sutherland is in anthropology at Macalester College, St. Paul, MN. (v6,#1)

Sutherland, D. Dixon, "The Space of Creation: Theology's Search for an Ecological Ethic," Communio Viatorum 1 XXXVI 1994, pages 46-60. Communio Viatorum is published by the Protestant Theological Faculty of Charles University, Prague. The historic cords that bind the ecological crisis and Christian theology together run deeper than expected. Modern theology and the ecological crisis cannot be separated. The roots of both are historically and substantively entangled. In a profound sense, the ecological crisis of the twentieth century has propelled theology into its own severe crisis. Dixon teaches Christian ethics at Stetson University, DeLand, Florida. (v7,#2)

Suzuki, David, with McConnell, Amanda, The Sacred Balance: Rediscovering Our Place in Nature.

Amherst, NY: Prometheus Books, 1998. 269 pages. Cloth \$26.00. "Nature is the ultimate source of our inspiration, of our sense of belonging, of our hope that life will survive long after we are gone. In order to realize this hope, we must learn to regard the planet as sacred." Suzuki is a Canadian media celebrity, and geneticist, host of a popular science program, "The Nature of Things."

Suzuki, David and Peter Knudtson, eds., Wisdom of the Elders: Sacred Native Stories of Nature. New York: Bantam Books, 1992. 275 pages. Cloth and paper. Several dozen vignettes characterizing native ecologies from around the world. Each chapter is organized beginning with a thumbnail sketch of modern scientific perspectives relevant to the chapter's theme, as a backdrop against which the native vignettes are juxtaposed. The editors are impressed with the fundamental validity and power of aboriginal notions of the sacredness of nature. Suzuki is professor of zoology at the University of British Columbia and a distinguished Canadian broadcaster and environmentalist. Knudtson is a Vancouver-based journalist. (v4,#4)

Svancara, LK, et al., "'Policy driven versus Evidence based Conservation: A Review of Political Targets and Biological Needs," BioScience 55 (no. 11, November 2005): 989-995. "How much is enough?" is a question that conservationists, scientists, and policymakers have struggled with for years in conservation planning. To answer this question, and to ensure the long term protection of biodiversity, many have sought to establish quantitative targets or goals based on the percentage of area in a country or region that is conserved. In recent years, policy driven targets have frequently been faulted for their lack of biological foundation. In this manuscript, we reviewed 159 articles reporting or proposing 222 conservation targets and assessed differences between policy driven and evidence based approaches. Our findings suggest that the average percentages of area recommended for evidence based targets were nearly three times as high as those recommended in policy driven approaches. Implementing a minimalist, policy driven approach to conservation could result in unanticipated decreases in species numbers and increases in the number of endangered species.

Swanson, Stevenson, "To Bring Back Starry Skies, Local Ordinances Restrict Excess Illumination," Washington Post (12/25/97): A 19. Community Ordinances to Protect Starry Sky. A growing number of local governments are regulating lighting to prevent unsafe glare and to bring back the night sky. The U.S. is so well illuminated that only one in 10 Americans lives in a place where light pollution has not marred the beauty of the night sky. These ordinances require that new lighting be shielded so that light is directed downward, not sideways or up, and they require that outdoor lights not needed for security must be reduced or turned off after business hours. In addition to making the night sky more visible, the ordinances aim to make driving more safe by reducing glare that can temporarily blind or disorient motorists. (v.8,#4)

Swanson, Timothy M., ed. The Economics and Ecology of Biodiversity Decline: The Forces of Driving Global Change. New York: Cambridge University Press, 1995. 176 pages. \$39.95 cloth. Economists analyze how economic growth predictably alters the earth, and ecologists consider how the drive for fitness and consequent population growth changes the globe. Both look at the institutional interface between humans and biosphere, and explain global change as the consequence of human noncooperation and conflict. (v7, #3)

Swanson, Timothy M., and Edward B. Barbier, eds. Economics for the Wilds: Wildlife, Wildlands, Diversity and Development. London: Earthscan, 1992. 226 pages. £ 12.95, paper. The only way to save wildlife is to make it economically profitable to save them. The reason wildlife is now under threat is that there are so few economic incentives; the vast majority of species are refugees of the international economic system. Unless we find ways of integrating these wild values into the economic system, wildlife and wildlands face a bleak future. They cannot be saved in peopleless parks. Unfortunately, the largest reserves of biological diversity lie in some of the poorest countries of the world, and it is neither fair nor prudent to ask developing countries to preserve wildlands, especially when the developed countries have destroyed theirs. The contributors suggest new ways of making wildlife and wildlands count economically. Bruce Aylward, "Appropriating the Value of Wildlife and Wildlands" argues, however, that there are some aspects of biodiversity that cannot be brought into economic arguments. Questions of our moral obligations to nonhuman species are given scant treatment here; most of the authors hold that such moral arguments are likely to be increasingly flimsy in the face of overwhelming population pressures and the inequitable trading relations and development patterns between North and South. Swart, Jac. A.A., "Care for the Wild: An Integrative View on Wild and Domesticated Animals," Environmental Values 14(2005): 241-250. Environmental ethics has to deal with the challenge of reconciling contrasting ecocentric and animal-centric perspectives. Two classic attempts at this reconciliation, which both adopted the metaphor of concentric circles, are discussed. It is concluded that the relationship between the animal and its environment, whether the latter is human or natural, should be a pivotal element of such reconciliation. An alternative approach is presented, inspired by care ethics, which proposes that caring for wild animals implies caring for their relationship to the natural environment and thus taking action to maintain wildlife habitat. This type of care is labelled non-specific care because it is not directed towards the individual wild animal and its specific individual needs. In contrast, caring for domestic animals is called specific care because it is much more directed towards the individual animal's needs. Swart is in biology, University of Groningen, The Netherlands. (EV)

Swart, Jac. A.A., "The Wild Animal as a Research Animal," Journal of Agricultural and Environmental Ethics 17(2004):181-197. Most discussions on animal experimentation refer to domesticated animals and regulations are tailored to this class of animals. However, wild animals are also used for research, e.g., in biological field research that is often directed to fundamental ecological-evolutionary questions or to conservation goals. There are several differences between domesticated and wild animals that are relevant for evaluation of the acceptability of animal experiments. Biological features of wild animals are often more critical as compared with domesticated animals because of their survival effects. An important issue is what is called here "natural suffering": the suffering from natural circumstances. Should this type of suffering be taken into account when suffering from experimentation is evaluated? As an answer, it is suggested that "natural functioning" should be considered as an additional standard in the evaluation of wild animal experimentation. Finally, two topics related to the ecological context are considered. Firstly, the often inevitable involvement of non-research animals in wild animal experimentation, and secondly, the eco-centric approach to nature conservation. According to the latter position, animals are subordinated to ecosystems. All these aspects make the evaluation of wild animal experiments much more complex than experiments with domesticated animals. Preliminary scores are proposed to deal with these aspects. It is argued that this should not lead to a more complex governmental regulation, since an effective maintenance and control are hard to realize and one may lose the cooperation of researchers themselves. In addition, non-governmental professional organizations such as research societies and funding organizations play a pivotal role. Keywords: animal experimentation, animal welfare, domesticated animals, field biological research, natural functioning, natural suffering, wild animals

Swearingen, Jack C. "Brownfields and Greenfields: An Ethical Perspective on Land Use." Environmental Ethics 21(1999):277-292. America's industries and families continue to forsake cities for suburban and rural environs, in the process leaving nonproductive lands (brownfields) and simultaneously

removing greenfield land from agriculturally or biologically productive use. In spite of noteworthy exceptions, urban regions which once functioned as vital communities continue in economic and social decline. Discussion or debate about the problem (or, indeed, whether it is a problem at all) invokes systems of values which often are not articulated. Some attribute the urban exodus to departure from personal ethical norms (e.g., substance abuse, violence, welfare addiction) by urban residents, as though ethical decline is driving the phenomenon. Others take the exact opposite stance, that social and economic decline follow the departure of the economic base. There is no consensus on what government should do about the problem, or whether government should be involved at all. I present elements of a land-use ethic which can accommodate the foregoing. I argue that government is already involved in the brownfields problem because urban flight is facilitated by public policies which de facto subsidize the process. I further argue that the debate invokes key--but unexamined--assumptions regarding limits. Where there are few substitutes for resources and the social cost of exploitation is high, government intervention in the market is necessary; "value-free" economic approaches need to be supplemented by values concerning what ought to be, i.e., what is desirable for society. (EE)

Swearingen, Thomas Craig. Moral Development and Environmental Ethics. Ph.D. dissertation in the College of Forest Resources, University of Washington, 1989. Available through University Microfilms, Ann Arbor, MI. 293 pages. Kohlberg's theory of moral development is relevant to the development of environmental ethical reasoning. Kohlberg is Western and anthropocentric. His theory is extended and adapted to environmental ethics. An instrument is developed to measure principled moral reasoning with an environmental orientation. Approximately 25,000 subjects were observed in a national park; persons observed to engage in environmentally destructive behavior and a matched random sample of other visitors were studied, 568 respondents. Analyses indicate that the subjects' responses are consistent with the extended theory hypothesizing stages in the development of environmental ethical reasoning. The thesis advisor was Robert G. Lee. A paper in progress, continuing this research is, "The Development of an Environmental Morality: A Theoretical Synthesis." Swearingen teaches in the Department of Health, Physical education, and Leisure Studies, University of Alabama, Mobile. (v6,#3)

Sylvan, Richard, "What Is Wrong with Applied Ethics?" One problem is the delivery of the commodity, but deeper problems lie in the applied idea and in what the application is presumed to be made to. There is something odd about the very idea of applied ethics, rather like applied nursing. All ethics is applied; there is no pure ethics. But further, environmental ethics challenges the whole body of ethical theory, not just application. The label "applied" is substantially a misnomer. A main matter with the body of ethics is its anthropic bias. Three options that emerge are inappropriate application, or extension or adjustment, and fashioning of something new, and these correspond more or less to the threefold division of environmental positions: shallow, intermediate, and deep. A provocative and insightful paper. This paper was given at a conference, "Philosophy and Applied Ethics Re-examined," at the University of Newcastle in August 1993. (v5,#1)

Sylvan, Richard, and David Bennett, The Greening of Ethics: From Human Chauvinism to Deep-Green Theory. Tucson: University of Arizona Press; and Cambridge UK: White Horse Press, 1994. Pp. 269. \$22.95 paper, \$45.00 cloth; £11.95 paper, £29.95 cloth. Environmental ethics from "down under" showing how topsy turvy the uppermost Western, first world view really is. The most insightful work of many to come out of Australia so far as it seeks to define, in its own national development, Australia's unique contribution to the greening of ethics. Forceful, critical, subversive, even satirical, and, ultimately, quite constructive, Sylvan and Bennett show that if conservation fails in Australia, then all hope of convincing the rest of the world of its importance is dead.

Sylvan and Bennett's analysis is by no means peculiarly Australian. Environmental ethics, they argue, everywhere comes in shallow, intermediate, and deep forms, and the authors use their position to evaluate what is happening in Europe and the United States. In their most original chapter (5), the authors set out their "deep-green theory," both sharing features with, and contrasted with, "deep ecology." The earlier chapters are mostly "de-constructionist," but in conclusion the authors advance their own construction of an appropriately green ethics based on intrinsic value in nature. The final chapters look at practical applications, always more radical than we like first to suppose. Sylvan is in philosophy at the Research School of Social Sciences, Australian National University, Canberra. Bennett is environment officer with the Aboriginal and Torres Strait Islander Commission in Canberra. (v5,#4)

Sylvan, Richard, "War and Peace IV: Tao and Deep-Green," 23 page typescript. Taoism and deep-green environmental theory diverge over war. Taoism is not a pacific doctrine but is committed to skilful defensive militarism, limited defensive military operations for specific purposes. Deep-green theory stands opposed to professional militarism, and is committed to a principled pacifism. Conveniently, a route through Taoism leads to problems of pacifism and toward a deep green theory. Available from Department of Philosophy, Research School of Social Sciences, Australian National University, P. O. Box 4, (v2,#4)

Sylvan, Richard, and David Bennett, The Greening of Ethics. Cambridge, UK: Whitehorse Press, 1994. 300 pages. £ 11.95. Chapter titles: Ethics and its Reluctant Greening, Set Against Escalating Environmental Problems. Shallow Environmental Ethics. Intermediate Environmental Ethics. A Prominent Deep Environmental Movement: Deep Ecology. An Outline of Deep-Green Theory, by Way of Contrast with Deep Ecology. On the Development of Environmental Ethics. On Ways and Means of Marketing, Propagating, Inculcating and Implementing Environmental Ethics. Suggestions on a Range of Initiatives and for Action. The authors claim "that Australia has become a bellwether territory," and hold that "if conservation fails in Australia then all hope of convincing the rest of the world of its importance is dead." The work grows out of a UNESCO study on environmental ethics in Australia; it has an Australian flavor and cast. There is, throughout, a subversive tone, in the best philosophical sense, in that it casts a steady critical eye over the traditional, that is, modernist assumption of the European West, its domination over nature, its worship of entrepreneurial, capitalist economics, its arrogant colonialism, the British sense of empire of which Australia is a result.

One gets the sense that one is reading a book by disaffected renegades who know the tradition they are rebelling against inside out, products of it themselves, and making criticisms too forceful and well put for one to dismiss them as those of idiosyncratic disaffection. There is insight here that cannot or ought not be ignored. Chapters 1-4 are deconstructionist, but the authors construct their own deep green theory in Chapter 5 in a highly original way. Chapters 6, 7, 8 are on "applying" ethics, a term the authors rightfully find problematic, with persistent criticism of the idea of development, asking what it is that one wants to develop. Ideas like "marketing, propagating, inculcating, packaging, and implementing" environmental ethics are real teasers because every word is loaded; the authors are taking the terms of the standard worldview and using them subversively to show the limitations of the marketing mentality. The authors are in philosophy at the Research School of Social Sciences, Australian National University, Canberra; see below. An American co-publisher is University of Arizona Press. (v5,#1)

Sylvan, Richard, "Mucking with Nature" In Sylvan, Against the Main Stream. Discussion Papers in Environmental Philosophy, no. 21. Canberra: Research School of Social Sciences, Australian National University, 1994. Criticizes Robert Elliot's "Faking Nature," Eric Katz, "The Big Lie: Human Restoration of Nature," and Eugene Hargrove on "therapeutic nihilism."

Sylvan, Richard, "Problems and Solutions in Radical Deeper Green Political Theory: An Australian Perspective." There is a growing dissatisfaction with Australia's political institutions, and increasing demand to change them. This demand has been initiated top-down; there is so far little surge from grass-roots levels. Nonetheless, along with apathy, there is widespread popular disenchantment. There is now an opportunity, if a rather small window of opportunity, to get green and radical themes on the agenda for

real political change in Australia. That opportunity should not be missed. (v5,#1)

Sylvan, Richard, Transcendental Metaphysics. Cambridge, UK: The White Horse Press, 1998. 500 pages. £ 45.00. Sylvan links his "deep green" theory of environmental philosophy to wide-ranging work in metaphysics, semantics, logic and value theory, his last work just completed before he died. Pioneering, eclectic, and controversial. Sylvan advocates "plurallism" (sic). "There is not merely a plurality of correct theories and more or less satisfactory worldviews: there is a corresponding plurality of actual worlds. Plurality penetrates deeper in full plurallism than linguistic surface or than conceptual or theoretical structure, to worlds ... There is no single fact of the matter, there are facts and matters."

Contents:

Chapter 1. Introducing and placing full and deep plurallisms

Chapter 2. Explaining full metaphysical plurallisms: their features, their differences.

Chapter 3. Paths and arguments leading to deep plurallism: vias negativas Chapter 4. More arguments to deep plurallism: vias positivas

Chapter 5. Still more positive arguments to plurallism

Chapter 6. Worlds and wholes: their natures and relative features

Chapter 7. Talking and thinking plurallese as well as more ordinarily: modellings and discourse

Chapter 8. Making a wider metaphysical sweep: traditional notions, traditional pluralism, traditional objections

Chapter 9. Distancing plurallism from realism, anti-realism and relativism, and those other -isms

Chapter 10. Plurallistic investigation of relevant philosophers and philosophical schools

Chapter 11. Impacts upon Philosophy: harmonious applications and further problem-solving

Chapter 12. What deep plurallism does, its intellectual impact, and where it leads

Chapter 13. Beyond intellectual plurallism--to liberating practice

Richard Sylvan was Senior Research Fellow in the Philosophy Program at the Australian National University. (v9,#1)

Sylvan, Richard, "A Critique of (Wild) Western Deep Ecology: A Response to Warwick Fox's Response to an Earlier Critique," manuscript paper. "Western deep ecology differs in important respects from the deep ecology originated and pursued by Naess, ... authentic deep ecology. ... Western deep ecology ... is very roughly a doctrine of the west of those new world continents where environmental philosophy functions; it has been advanced primarily by West Coast Americans (Devall, Drengson, Sessions and others) and associated West Australians (Fox, now of Tasmania, also Hallem and others). Unlike authentic deep ecology, Western deep ecology is hostile to environmental ethics, which it tends to dismiss as mere axiology; and it is excessively enthusiastic about transpersonal experience, spiritual 'paths' and 'ways', and unitarian metaphysics. ... On a personal level, I am quite attracted by authentic deep ecology; but I am substantially repelled by Western deep ecology." Available from: Department of Philosophy, Research School of Social Sciences, Australian National University, P. O. Box 4, Canberra, ACT 2600. (v1,#2)

Sylvan, Richard, "A Critique of Deep Ecology." Radical Philosophy 40 (Summer 1985): 2-12 and Radical Philosophy 41 (Fall 1985). A difficult paper to understand but absolutely essential as an analysis of the popular Deep Ecology movement. Sylvan (formerly Routley) has been a leading critic of anthropocentric environmental ethics, and thus his criticisms of an environmental philosophy closely aligned with his views is all the more impressive. Sylvan attacks Deep Ecology for being too vague: it is based on unsupported intuitions that actually permit anthropocentric biases to creep in. The problem is traced to the deep ecologist's avoidance of rational argument. There is an inconsistency between biospherical

egalitarianism and holism: all the parts of the ecosystem cannot have equal value if the system itself is to be protected. Deep Ecology tries to emphasize the importance of life--and distorts the concept by including as living entities such systems as "river"--but life should not be as important as the system of nature. Finally, the Deep Ecology goal of "self-realization" lends itself to a criterion of value based on experience, and perhaps conscious experience--self-direction. In sum, Sylvan argues that because of its vagueness, Deep Ecology claims to support many positions that actually undermine a real environmental perspective. (Katz, Bibl # 1)

Sylvan, Richard, "Gaeian Greenhouse, Nuclear Winter, and Anthropic Doomsday," Research Series in Unfashionable Philosophy, No. 4, 1990, Division of Philosophy and Law, Research School of Social Sciences, Australian National University, Canberra. Some provocative reflections, especially on the greenhouse effect. Possible responses rationally assessed, pessimism, skepticism, but Sylvan concludes: "From the angle of radical change, then, the impact of the Greenhouse problematique is far from entirely negative. For it may encourage or even force many more of us into thinking about and doing what should be done from a deep perspective anyway, such as rectifying recent heavy human impact upon environments, and beginning at once to put in place more environment-friendly arrangements and structures." No. 4 in this series includes two other papers by Sylvan, "As to the Purpose of the Universe," and "Illogic and Illusion in Biologic Evolution." Available from Department of Philosophy, Research School of Social Sciences, Australian National University, P. O. Box 4, Canberra, ACT 2600. (v1,#2)

Sylvan, Richard, "Paradigmatic Roots of Environmental Problems." Virtually all diagnoses of the roots and sources of environmental problems are defective, and hence the problems will not be adequately addressed. The roots of the problem are typically found in answers that do not question entrenched paradigms but seek to explain problems through defective practice, or in those that do look to entrenched paradigms, but are flawed by a monist concentration on a single paradigm, or a single narrow band of paradigms. Sylvan seeks a wider, more satisfactory answer. He disentangles in detail proposed and alleged sources of the problems; none of these answers is satisfactory. A different, more complex answer through broader classes of paradigms is investigated. One result is that philosophy portrayed through its standard history is dismal environmental news. Sylvan (d. 1996) was professor of philosophy, Research School of Social Sciences, Australian National University. (v5,#1)

Szathmary, Eörs, Jordán, Ferenc, and Pál, Csaba, "Can Genes Explain Biological Complexity," Science 292(2001):1315-1316. The number of genes correlates poorly with complexity in plants and animals. An important further factor is the number of networks that can be established by transcription factors and the genes they regulate. Immune systems and brains are more complex than the genes that generate them. There may be a significant analogy to ecosystems, where the number of species is not the main consideration in complexity of ecosystems, but the number of connections between species. We need to distinguish between two forms of complexity: one measured by the number of genes and the other by the connectivity of gene regulation networks. The authors are in the Collegium Budapest (Institute for Advanced Study). (v.12,#2)

Sze, Julie. *Noxious New York: The Racial Politics of Urban Health and Environmental Justice*. Cambridge, MA: The MIT Press, 2006. Sze relies extensively on fieldwork and interviews with community members and activists to track urban planning and environmental health activism in Brooklyn's Sunset Park and Williamsburg sections, West Harlem, and the South Bronx in response to economic decay and a concentration of noxious incinerators, solid waste transfer stations, and power plants. The emergence of local campaigns organized around issues of asthma, energy systems, and garbage in the 1980s and 1990s is linked to the nineteenth century's sanitation movement and New York's history of garbage, sewage and sludge management.

Szerszynski, Bronislaw. "Risk and Trust: The Performative Dimensionl." Environmental Values 8(1999):239-252. ABSTRACT: This paper will explore some of the implications of attending to the performative aspects of language for the sociological understanding of issues of risk and trust among lay communities. Ulrich Beck and Anthony Giddens have alerted us to the way that in late or reflexive modernity trust in authority cannot be taken for granted, but increasingly has to be actively earned and actively invested. For his part, Brian Wynne has pointed out that lay judgements are relational and hermeneutic, including as they do judgements about the behaviour of relevant expert institutions, and about the risk to one's self-identity incurred by being caught up in relationships of dependency. Wynne has also argued that public avowals of trust can often mask deep private distrust, and thus be expressions more of fatalistic acceptance than of genuine trust. However, all of these analyses work from a basic model of "trust" as being the result of a cognitive process - as a judgement as to the trustworthiness of others. Yet trust is frequently "active" in an even stronger sense than this. To take a posture of trust towards another can often be best understood not just as a cognitive judgement but as an attempt to bind the "trusted" into a relationship and attitude of responsibility - and thus perhaps to alter their behaviour - through the taking up of a position in a social ritual. Speech act theory can help us be sensitive to this sort of use of the language of "trust", by reminding us that language can perform a number of different functions - not just that of describing the world, or of acting out ascribed roles and identities, but also that of trying to change the world. The analysis of public discourse about risk, trust and mistrust must thus be sensitive to the range of things that people might be attempting to do when they are saying things if it is to avoid drawing misleading conclusions about public attitudes to risk. Sztybel, David, "Marxism and Animal Rights," Ethics and the Environment 2(1997):169-185. There is no doubt that Marx and Engels rejected animal rights. However, they did embrace the communist principle, "From each according to his abilities, to each according to his need." Furthermore, they acknowledge that nonhuman animals have needs. So the principle can enjoin us to respect animals' needs, even if they lack certain abilities (e.g., tool-making, perhaps even self-consciousness). I argue that it is essentially speciesist to restrict this principle to human beings, and that its acceptance implies either animal rights or a substantive equivalent. Marxism may have to undergo a profound dialectical transformation in light of the implications of its own maxim. Sztybel is completing a doctorate at the University of Toronto. (E&E)

Sztybel, David, "Can the Treatment of Animals Be Compared to the Holocaust?" Ethics and the Environment 11(2006):97-132. The treatment of animals and the Holocaust have been compared many times before, but never has a thoroughly detailed comparison been offered. A thirty-nine-point comparison can be constructed, whether or not one believes that animals are oppressed. The question of whether or not the comparison ought to be expressed merely brings into question whether animal liberationists have liberal-democratic rights to express themselves, which they surely do. Four objections are considered: Is the comparison offensive? Does the comparison trivialize what happened to the victims of the Nazis, overlook important differences, or ignore supposed affinities between animal liberationists and Nazis? These four lines of attack are shown to fail. The comparison stands to help us to reflect on the significance of how animals are treated in contemporary times. Sztybel finished a doctorate in animal rights ethics at the University of Toronto. (Eth&Env)

Sztybel, David. "Animal Rights: Autonomy and Redundancy." Even if animal liberation were to be adopted, would rights for animals be redundant - or even deleterious? Such an objection, most prominently voiced by L. W. Sumner and Paul W. Taylor, is misguided, risks an anthropocentric and anthropo-morphic conception of autonomy and freedom, overly agent-centered rights conceptions, and an overlooking of the likely harmful consequences of positing rights for humans but not for nonhuman animals. The objection in question also stems from an overly pessimistic construal of autonomy-infringements thought to result from extending rights to animals, and also, of confusions that supposedly may ensue from ascribing animal rights. Whether or not a case for animal liberation and/or animal rights can cogently be made, the redundancy-or-worse objection to animal rights need pose no barrier. Keywords: animal liberation, animals, anthropocentrism, anthropomorphism, autonomy, ethics, rights, utilitarianism. Sztybel is in the Philosophy Department, University of Toronto, Toronto, Ontario, Canada. (JAEE)

Takacs, David, The Idea of Biodiversity. Philosophies of Paradise. Baltimore: Johns Hopkins University Press, 1996. Biodiversity as a social construct. "It is difficult to distinguish biodiversity, a socially constructed idea, from biodiversity, some concrete phenomena" (p. xv). "This book is about the dialectic between two natures: nature, the real world that surrounds us, and "nature," how we portray the world.

Or, rather, it is about the dialectic between biodiversity, the notional totality of life on this planet, and biodiversity, the term biologists have concocted as an approximation for that totality: a scientized synonym for nature, imbued with the values biologists cherish. The term biodiversity is only a decade old, but it stems from nature and wilderness, notions whose roots burrow deep into human history. In a rare opportunity to watch the conscious creation and dissemination of a new paradigm of our conceptions of nature, we are able to examine how and why biologists have concocted and promoted the word" (pp. 105-106).

The originator and chief advocate, and constructor, of biodiversity is E. O. Wilson. "Wilson is stitching together nothing less than a new 'natural' religion, with biodiversity as the icon of worship. He seeks to lead a corps of renaissance biologist acolytes in the mission to spread the new eco-gospel" (p. 310). Takacs interviewed some 40 biologist / advocate / constructors of biodiversity. He is convinced "biodiversity" is constructed, a new religion; but he halfway believes it himself, and he does want to respect and save nature. (v.13,#1)

Takacs, David. The Idea of Biodiversity: Philosophies of Paradise. Baltimore, Maryland: The Johns Hopkins University Press, 1996. 500pp. \$35.95. Takacs analyzes what biodiversity represents to the biologists who operate in broader society on its behalf, drawing on in-depth interviews with the scientists most active today in the mission to preserve biodiversity, including Peter Raven, Thomas Lovejoy, Jane Lubchenco, and Paul Ehrlich. He also looks at the work of twentieth-century forerunners of today's conservation biologists--Aldo Leopold, Charles Elton, Rachel Carson, David Ehrenfeld--and points out their contributions to the current debates. He takes readers to Costa Rica, where a group of scientists is using biodiversity to remake nature and society. An extended section profiles the thoughts and works of E.O. Wilson. (v8,#1)

Talbert, Matthew. "Contractualism and Our Duties to Nonhuman Animals." Environmental Ethics 28(2006):201-215. The influential account of contractualist moral theory offered recently by T. M. Scanlon in *What We Owe to Each Other* is not intended to account for all the various moral commitments that people have; it covers only a narrow—though important—range of properly moral concerns and claims. Scanlon focuses on what he calls the morality of right and wrong or, as he puts it in his title, what we owe to each other. The question arises as to whether nonhuman animals can be wronged in the narrow sense of a moral wrong with which contractualism is concerned. Can we owe things to nonhuman animals? Scanlon is sensitive to the importance of this question, but he ultimately favors an account in which the perspectives of nonhuman animals are not explicitly included in contractualist theorizing. Nevertheless, it appears that contractualism, largely as Scanlon conceives it, can accommodate duties to nonhuman animals. Moreover, if contractualism cannot make this accommodation, then its status as a theory that answers to important common-sense moral intuitions becomes questionable in ways that extend beyond its failure to live up to intuitions many share about the status of nonhuman animals. Talbott, Steve, "A Conversation with Nature," The New Atlantis, No. 3, Fall 2003, pages 34-46. Between the extremes of ridding nature of all human influence and total management of nature, perhaps we humans can have a conversation with nature. "I would like to think that what all of us, preservationists and managers alike, are really trying to understand is how to conduct an ecological conversation. We cannot predict or control the exact course of a conversation, nor do we fall any such need-not, at least if we are looking for a good conversation. Revelations and surprises lend our exchanges much of their savor. We don't want predictability; we want respect, meaning coherence. A satisfying conversation is neither rigidly programmed nor chaotic, somewhere between perfect order and total surprise we look for a creative tension, a progressive and mutual deepening of insight, a sense that we are getting somewhere worthwhile." (p. 36). Talbott is a senior researcher at the Nature Institute. (v. 15, # 3)

Tallacchini, Mariachiara, "A legal framework from ecology," Biology and Conservation 9(2000):1085-1098. Abstract. This paper proposes some legal principles for environmental protection as outlined from ecology. Such an environmental legal framework consists essentially of three criteria which deal (1) with ecological limits, (2) Gestalt and (3) uncertainty. These guidelines for an ecologically-oriented law are defined as normative because they show that there is a link between ecological descriptions and legal prescriptions. Key words: ecology, environmental normative principles, law. Tallacchini is in law, Dipartimento di Teoria e Storia de l Diritto, University of Florence, Italy. (v.13,#1)

Tallacchini, Mariachiara, "Human Right to the Environment or Rights of Nature?" in Martin, Rex, and Sprenger, Gerhard, eds., Challenges to Law at the End of the 20th Century: Rights. Vol. I. Proceedings of the 17th World Congress of the International Association for Philosophy of Law and Social Philosophy (IVR), Bologna, June 16-21, 1995. Stuttgart: Franz Steiner Verlag, 1997. In English. The environment is a fairly recent object for law and rights. The need to place limits of human intervention in the environment has led to two opposing theories of rights: (1) the human right to the environment, which protects man from man in the exploitation of nature, and (2) the rights of nature, which protect nature from man. The environment as an object of a human right is the expression of the so-called third generation of human rights--whose reference-value is solidarity, "freedom together,"--and aims at defending human beings from environmental degradation produced by industrial development. The configuration of the rights of nature swings between extreme conceptions: a minimal one, which merely exploits the emphasis of the language of rights to refer to human duties; a maximal one, according to which "biorights" are "the rights of unique landscapes to remain untouched." The first considers subjective rights as a mere persuasive formula, the second leads to the contradictory consequence whereby the complete intactness of nature demands the disappearance of man and of law. But if the expression "rights of nature" is to have any meaning at all, the meaning is to be sought by excluding these two definitions. (v.8,#4)

Tallacchini, Mariachiara, Diritto per la natura: Ecologia e filosofia del diritto (Law for Nature: Ecology and Philosophy of Law). Torino: Giappichelli, 1996. 410 pages. ISBN 88-348-6139-6. Lire 40.000. Inadequate attention has so far been paid to philosophical reflection on the bases of environmental law, that is, on the conception of the relation between human beings and nature implicit in the growing legal concern with the environment. "Shallow" and "deep" ecophilosophies offer opposite ways of solving the tormented relationship between human beings and nature. Shallow ecologies, here called "environmentalist," hold an anthropocentric point of view and attribute to nature an instrumental value. Deep ecologies, here called "ecologist" philosophies, instead take an ecocentric point of view, that of the biosphere, and claim for nature an intrinsic value. "Environmentalisms" do not uphold great innovations

in the relationship with nature, only a cautious management of resources; "ecologisms" introduce an attempt to "think like a mountain" and so inspire human actions with the principle of non-interference in ecosystemic processes.

Italian laws on the environment appear as an inextricable entangling of not always consistent norms, due to the lack of a specific constitutional rule protecting the environment as a fundamental value. They reveal an attitude aimed more at repairing nature than preventing damage. European law consists almost of principles, and the original economic inspiration of the 1956 Rome treaties is difficult to reconcile with the ecological caring implicit in the Maastricht agreements. International law, lastly, appears torn between old principles, which still recognize single states as autonomous sovereign units and the new global reality, which makes of the Earth a single common home.

What are the links between positive law and environmental philosophies? Legal system risk failing in their intent to safeguard the environment unless they have a consistent sustainable attitude as a basis for decisions. From remote times, law has been responsible for environmental degradation, an anthropocentric ideology. After a critical examination of the new rights for the protection of the biosphere (human right to the environment, animal rights, nature's rights), the author outlines, with the idea of "law for nature," a legal framework for an adequate protection of nature. From the methodological point of view, there is the assumption of a systemic Gestalt in line with deep ecology. From the axiological point of view there is the adoption of a weak, humble anthropocentrism, in line with the most advanced approaches of shallow ecology. From this paradigm "ecological normativity" flows. Sustainable law "must" have three elements:

(1) Normativity of limits (law of limits). The finiteness of the world becomes the starting point from which to define the rights and the concrete basis for the goal of uncertainty.

(2) Normativity of uncertainty (law of uncertainty). The uncertainty of ecological forecasts produces the need for a precautionary approach (as, for example in the precautionary principle of the Rio Declaration).

(3) Normativity of Gestalt (the law of Gestalt). It is necessary to elaborate new legal concepts, because ecological entities cannot always be grasped by traditional legal tools.

Tallmadge, John. "Saying You to the Land." Environmental Ethics 3(1981):351-63. In formulating the concept of a "land ethic," Aldo Leopold suggested that true conservation would begin when we enlarged our sense of community to include other organisms besides human beings. This cannot be done, I argue, until we begin viewing other beings in nature as worthy of existence on their own terms, rather than simply as means to human ends. I use Martin Buber's philosophy of dialogue, as expounded in "I and Thou", to shed light on the spiritual roots of our environmental crisis and show how we can appreciate beings in nature if we encounter them as persons rather than things. Applying Buber's concepts to the experiences of backpackers suggests that wilderness travel can help individuals develop habits of mind conducive to "I-You" relations, thereby enhancing our life with other people as well as with our natural environment. Tallmadge is in the department of English, Carleton College, Northfield, MN. (EE)

Tallmadge, John. Meeting the Tree of Life: A Teacher's Path. Salt Lake City: University of Utah Press, 1997. 220pp. \$44.95 cloth, \$18.95 paper. Tanke, Joseph J., "The Care of the Self and Environmental Politics: Towards a Foucaultian Account of Dietary Practice," *Ethics and the Environment* 12(no. 1, 2007):79-96. This essay appropriates the understanding of ethics developed by Michel Foucault in his courses at the College de France from 1980 until his death in 1984, with the aim of formulating a progressive environmental politics. As such, it attempts to navigate some of the long-standing divides between the movement for animal rights and environmental ethics proper, finding in the practice of vegetarianism a form of self-relation that is conducive to critical forms of speech and politics. The final phase of Foucault's work is replete with insights into how the care of the self can serve as a resistance to forms of power and political stasis. This paper presents these unpublished materials, allowing for a glimpse of the unknown Foucault, and reinterprets vegetarianism as a form of self-practice that is linked with truth and critical speech. Tanke is at Boston College, Boston.

Tanner, Randy, "Inholdings within Wilderness: Legal Foundations, Problems, and Solutions," International Journal of Wilderness 8(no. 3, December 2002):9-14. Legislation varies but typically owners of inholdings have to be given "reasonable use and enjoyment" of their lands, though these uses are not to disturb the quality of or be incompatible with the surrounding wilderness. Owners are to be given "adequate access" (which may not be motorized access) or the government shall offer exchange of land of approximately equal value. Most of the debate turns on what access is adequate and whether the offer of exchange must be accepted in lieu of access. Condemnation on Western wilderness is possible, but requires an Act of Congress. Condemnation on Eastern wilderness is possible by agency action, but has never been used. A legal article, worth an ethical analysis. Tanner is a graduate student the University of Montana.

Tanner, Thomas, ed., Aldo Leopold: The Man and His Legacy. Ankeny, Iowa: Soil Conservation Society of America, 1987.

Tanner, Thomas, ed., Aldo Leopold: The Man and His Legacy. Published in 1987, this book is still available from a somewhat atypical publisher and many interested in environmental ethics have probably neglected to obtain it. This volume resulted from an Aldo Leopold Centennial Celebration at Iowa State University. Contains 13 essays by Susan Flader, Baird Callicott, Roderick Nash, Curt Meine, Raymond Dasmann, Bruce Babbitt and others, and reminiscences by members of Leopold's family, Carl Leopold, Estella Leopold, Luna Leopold, Nina Leopold Bradley, and Frederic Leopold. Published by the Soil Conservation Society of America, 7515 Northeast Ankeny Road, Ankeny, Iowa 50021. \$ 10.00. Phone 515/289-2331 or 1-800-THE-SOIL. (v2,#2)

Tanner, William F., "'Planet Earth' or 'Land'?" Perspectives on Science and Christian Faith 49 (no. 2, June 1997):111-115. Ancient Greek and Hebrew words which are commonly translated as "earth" ("Earth") or "world" in the English Bible do not refer to the planet on which we live, but rather to "land," "country," "ground," "soil" or "dirt." The meaning of "all the Earth" is vastly different from "all the land." The concept of our home as a planet was not known until many centuries later. The discovery by geographers that the Earth is essentially a sphere is not closely related to the equally important discovery that it is one of the planets. Modern English dictionaries do not invariably make the necessary distinctions, in some instances even citing "earth" (without an initial capital E) as the name (identification) of our planet, although other planets, such as Venus, are identified with a capital initial letter. The result is linguistic confusion and ambiguity. Tanner is at Florida State University. (v8,#3)

Tantillo, James, "Sport Hunting, Eudaimonia, and Tragic Wisdom," Philosophy in the Contemporary World 8 (Number 2, Fall-Winter 2001):101-112. Anti-hunters frequently overlook or underestimate the positive values associated with reflective sport hunting. In this essay I characterize the value of hunting in the context of an Aristotelian virtue ethic. Sport hunting done for the purpose of recreation contributes heavily to the eudaimonia (flourishing) of hunters. I employ Aristotelian insights about tragedy to defend hunting as an activity especially well-suited for promoting a range of crucial intellectual and emotional virtues. Reflective sport hunters develop a "realistic awareness of death" and experience what may be called "tragic" pleasure, which yields the important intellectual virtue of tragic wisdom. Tantillo has just finished a Ph.D. on hunting ethics in the Department of Natural Resources, Cornell University. (v.13,#2)

Tardiff, Andrew, "A Catholic Case for Vegetarianism," Faith and Philosophy 15(1998):210-222. Very few Catholics become vegetarians for moral reasons, and virtually no one would expect them to since vegetarianism seems to go hand in hand with views which are incompatible with the Catholic faith. But the Catholic Church accepts principles--widely accepted by others, too--which imply a conditional, though broadly applicable, obligation to avoid killing animals for food. Catholic thinkers have not hitherto applied these principles to vegetarianism, but have long used them in other ways. The case is built on texts from St. Thomas Aquinas and the Catechism of the Catholic Church. Tardiff is at Rhode Island College. (v.9,#3)

Tausch, Robin J., Peter E. Wigand, and J. Wayne Burkhardt, "Viewpoint: Plant Community Thresholds, Multiple Steady States, and Multiple Successional Pathways: Legacy of the Quaternary?," Journal of Range Management 46(1993):439-447. Ecological theory that has been the basis of vegetation management for most of this century is now being questioned. The legacy of Quaternary climate change is that plant communities are far less stable than they appear to be from our perspective (at least in the U.S. West). They are unique at each location, difficult to define, and communities that are relics from a previous environment can be sensitive to small or transient environmental changes. Many ecological principles and concepts, and ecosystem paradigms derived from them, require revision to incorporate this variation. Plants adapt to climate change as much by migrating as by genetic adaptation. In ecosystems, various plants are entering and leaving at various times. Many ecosystems have no one steady state, many can follow multiple successional pathways, often depending on small changes at threshold points. This calls for more hands on management and more managerial decisions about the routes preferred, since

there is no one natural state to be preferred. Tausch is at the US Forest Service Intermountain Research Station, Reno, Nevada, and Wigand and Burkhardt are at the University of Nevada. (v5,#4)

Tauson, Ragnar, "Research Approaches for Improving the Physical Welfare and Environment of Laying Hens", Journal of Agricultural and Environmental Ethics 6(1993), Supplement. Introductory studies at the Funbo-Lvsta Research Station, which included detailed observations of laying hens in commercial cages of different designs, revealed that there were large differences in cages with respect to bird welfare. Some findings were quite striking and had not been reported earlier, e.g. concerning plumage condition, foot health, frequency of trapped hens and neck skin atheroma. After discussion of the results with the manufacturers involved, a series of subsequent trials with modified as well as completely new cages was conducted which resulted in significant improvements in the welfare traits mentioned and often also improved the economics of egg production. The studies increased concern and awareness among most participating manufacturers and considerably affected cage design in many European countries. This development was followed by other additional design innovations studied on a small scale, e.g. the introduction of claw abrasive tapes and perches. In Sweden several of the findings have influenced subsequent animal welfare legislation, and recommendations based on the findings have also been proposed in other countries. A similar approach has been used in developing alternative systems like aviaries. In many respects the results reveal similar problems but of another character, and in particular involve foot health and trapping of hens. Because of the structure and large group sizes in the aviaries studied, the relative speed of development is considerably reduced as compared to cages. Due to the conditions required for alternative systems in Sweden by the Agricultural Committee, it seems that multiple-tiered aviary-like systems will require considerable research before they can become approved and accepted. This is due to factors such as the working environment with its very high content of respirable dust and unsuitable ergonomics, erratic outbreaks of feather pecking and cannibalism, the need for medication against endo-and-ecto-parasites and hence the question of residuals in the eggs, and generally low predictability. Tauson is in the Department of Animal Nutrition and Management, Swedish University of Agricultural Sciences, Funbo-Lövsta Research Station, 755 97 Uppsala Sweden.

Taylor, Angus, Animals and Ethics: An Overview of the Philosophical Debate Guelph, Ontario: Broadview Press, 2003. Taylor teaches philosophy at the University of Victoria in British Columbia. (v.10,#2)

Taylor, Angus, "Animal Rights and Human Needs," Environmental Ethics 18(1996):249-264. The idea that animal rights can be married to environmental ethics is still a minority opinion. The land ethic of Aldo Leopold, as interpreted by J. Baird Callicott, remains fundamentally at odds with the ascription of substantial rights to (nonhuman) animals. Similarly, Laura Westra's notion of 'respectful hostility,' which attempts to reconcile a holistic environmental ethic with 'respect' for animals, has no place for animal rights. In this paper, I argue that only by ascribing rights to sentient animals can an environmental ethic avoid an unacceptable degree of anthropocentrism because only a rights-based environmental ethic can prohibit humans from significantly interfering with sentient animals when human vital needs are not at stake. A rights view that permits significant interference when it is required for the satisfaction of human vital needs avoids problems that otherwise plague a rights view. The 'vital-needs rights view' reconciles the rights of animals with the satisfaction of human vital needs—including the vital need to have a

flourishing natural environment—suggesting a possible alliance between animal rights and deep ecology and revealing the connections among vital needs, capitalism, and environmental degradation. Taylor is in philosophy, University of Victoria, B.C. (EE)

Taylor, Bron, ed. Ecological Resistance Movements: The Global Emergence of Radical and Popular Environmentalism. Albany: State University of New York Press, 1995. \$19.95 pb. ISBN 0-7914-2646-7. To order, contact: CUP Services, POB 6525, Ithaca, NY 14851; 800-666-2211.

Ecological resistance movements are proliferating around the world. Some are explicitly radical in their tactics while others have emerged from a variety of social movements that, in response to environmental deterioration, have taken up ecological sustainability as a central objective. This book brings together a team of international scholars to examine contemporary movements of ecological resistance. The first four sections focus on the Americas, Asia and the Pacific, Africa, and Europe, and the book concludes with a selection of articles that address the philosophical and moral issues these movements pose, assess the trends found among them, and evaluate their impacts and prospects.

Contents: Introduction: "The global emergence of popular Ecological Resistance," Bron Taylor; "Earth First! and global narratives of popular ecological resistance," Bron Taylor; "With liberty and environmental justice for all: the emergence and challenge of grassroots environmentalism," Bob Edwards; "Bread and soil of our dreams: women, the environment and sustainable development--case studies from Central America," Lois Lorentzen; "Profits, parrots, peons: ethical perplexities in the

Amazon," Heidi Hadsell; "International native resistance to the new resource wars," Al Gedicks; "Visitors to the commons: approaching Thailand's "environmental struggles from a Western starting point," Larry Lohmann; "Grassroots environmental resistance in India," Vikram K. Akula; "Popular environmentalists in the Philippines: people's claims to natural resources," Emma Porio and Bron Taylor; "Grassroots resistance to dominant land-use patterns in Southern Africa," Yash Tandon; "Luta, livelihood and lifeworld in contemporary Africa," Ben Wisner; "Have a friend for lunch: Norwegian radical ecology versus tradition," David Rothenberg; "Between moderation and marginalization: environmental radicalism in Britain," Wolfgang Rudig; "Popular resistance and the emergence of radical environmentalism in Scotland," Brendan Hill, Rachel Freeman, Steve Blamires, and Alistair McIntosh; "Postmodern environmentalism: a critique of deep ecology," Jerry A. Stark; "In search of Gaian politics: earth religion's challenge to modern western civilization," Daniel Deudney; "In defense of banner hangers: the dark green politics of Greenpeace," Paul Wapner; "The effectiveness of radical environmentalists," Sheldon Kamieniecki, S. Dulaine Coleman, Robert O. Vos; "Popular ecological resistance and radical environmentalism," Bron Taylor.

Bron Taylor is Director of Environmental Studies at the University of Wisconsin-Oshkosh. Address: c/o Dept. of Religious Studies and Anthropology, Oshkosh, WI 54901. PH/FAX 414-235-7478, 414-424-7183 Office, Office FAX 414-424-0882; E mail: taylor@vaxa.cis.uwosh.edu. (v6,#4)

Taylor, Bron. "Earth First! Fights Back." Terra Nova 2, no. 2 (Spring 1997): 27-41. Examines the recent escalation of direct action resistance to logging, focusing on the campaigns at Cove-Mallard, Idaho, and Warner Creek, Oregon. Argues that given the record of government lawlessness in its administration of biodiversity-related environmental law, direct action resistance is morally justifiable and yet, grassroots activists must also redouble efforts to defend and strengthen environmental laws and increase citizen vigilance with regard to them. This latter endeavor is essential if activists are to force the government to employ the best science in its decision making and comply with its own statutory obligations. (v8,#2)

Taylor, Bron. "Earthen Spirituality or Cultural Genocide? Radical Environmentalism's Appropriation of Native American Spirituality." Religion 27 (1997): 183-215. The appropriation by non-Indians of Native American religious practices has become a highly contentious phenomenon. The present analysis focuses on the controversy as it has unfolded within the 'Deep Ecology' or 'Radical Environmental' Movement in North America. Taking as its central case study Earth First!, the radical vanguard of this movement, it describes the diverse forms such borrowing takes, the plural American Indian and non-Indian views shaping the ensuing controversy, and the threats this controversy poses to a nascent and fragile Indigenous-Environmentalist alliance. Concluding reflections address the ethics of appropriation with the aim of reducing the tensions attending these phenomena. (v8,#2)

Taylor, Bron. "Focus Introduction: Aquatic Nature Religion." *Journal of the American Academy of Religion* Vol. 75, no. 4 (2007): 864-74. Outdoor adventure and other recreational practices can express, evoke, and reinforce religious perceptions and orientations to natural and social worlds. Some participants in them understand nature itself to be sacred in some way and believe that facilitating human connections to nature is the most important aspect of their chosen practice. Such activities can be construed by scholars as "nature religion," and profitably analyzed by comparing characteristics commonly associated with religion to the beliefs and practices of participants engaged in these activities. Three case studies examined are surfing, fly-fishing, and whitewater kayaking.

Taylor, Martin F.J.; Suckling, Kieran F.; Rachlinski, Jeffrey J., "The Effectiveness of the Endangered Species Act: A Quantitative Analysis," BioScience 55(no.4, April 2005):360-368(9). Population trends for 1095 species listed as threatened and endangered under the Endangered Species Act were correlated with the length of time the species were listed and the presence or absence of critical habitat and recovery plans. Species with critical habitat for two or more years were more than twice as likely to have an improving population trend in the late 19= 90s, and less than half as likely to be declining in the early 1990s, as species without. Species with dedicated recovery plans for two or more years were significantly more likely to be improving and less likely to be declining than species without. The proportion of species improving increased, and the proportion declining decreased, with increasing time listed throughou= t the 1990s, irrespective of critical habitat and recovery plans. On the basis of these results, we recommend increased funding for earlier listing of imperiled species and prompt provision of critical habitat and recovery plans.

Taylor, Paul, "In Defense of Biocentrism," Environmental Ethics 5(1983):237-243. Taylor is a leading proponent of the "biocentric" outlook on moral valuation of nature: all natural entities have an equal inherent worth. Here he answers some criticisms of his view. Of particular interest is his distinguishing the content of the theory from both its practical significance and its psychological motivations. But he also admits that respect for individuals is not truly "ecological " and that the killing of natural entities is sometimes permissible. Thus the theory does not seem to be a proper basis of environmental protection. (Katz, Bibl # 1)

Taylor, Paul W. "In Defense of Biocentrism." Environmental Ethics 5(1983):237-43. Gene Spitzer has raised certain objections to my views on the biocentric outlook: (1) that a factual error is involved in the assertion that organisms pursue their own good, (2) that there is an inconsistency in the biocentric outlook, (3) that it is impossible for anyone to adopt that outlook, and (4) that the outlook entails unacceptable moral judgments, for example, that killing insects and wildflowers is as morally reprehensible as killing humans. I reply to each of these points, showing that the biocentric outlook on nature is not only a possible, but also a reasonable world view. Taylor is in the philosophy department, Brooklyn College of the City University of New York, Brooklyn, NY. (EE)

Taylor, Paul W., Respect for Nature: A Theory of Environmental Ethics. Princeton: Princeton University Press, 1986. Pp. ix, 329. This book is essential reading: it is the first book-length treatment of environmental ethics from the perspective of non-anthropocentric "intrinsic" natural value (although Taylor rejects this terminology). Taylor's position is not new or surprising, since he has been developing it in a series of articles in Environmental Ethics since 1981; nevertheless, this long treatment of the argument adds to the power of his views. The argument grounds a precise set of normative rules regarding the human treatment of nature on a particular axiology of natural value. Taylor's "theory of environmental ethics" has three components: First, there is a belief system or world view, which he calls

the "biocentric outlook on nature." A moral agent who holds this outlook is informed by current biological and ecological knowledge to conceive of himself and all humanity as members of "Earth's Community of Life." From this perspective, all living things are "unified systems of organized activity" that seek their own good. The biocentric outlook also denies human superiority; in theory, at least, it calls for a radical bioegalitarianism. Second, those who hold the biocentric outlook will adopt a particular moral attitude, "Respect for Nature," which involves valuing the individual natural living entities of the world as having inherent worth, i.e., value not based in any way on human purposes or experiences. Third, then, this attitude of respect for nature requires the formation of definite normative standards or rules for treating the natural wildlife of the world. Among these rules are the rule of nonmaleficence and noninterference.

Taylor is attempting to create an environmental ethic modelled after Kant's respect for persons; the difference is that natural wildlife takes the place of Kantian rational autonomous agents as the foci of moral value. This parallel between environmental ethics and human-centered ethics adds plausibility to the enterprise; yet the symmetry must fail, and does. Although Taylor denies human superiority, he devotes the entire last chapter to a discussion of conflicts between humans and wildlife which pays only lip service to a true bioegalitarianism. For Taylor, it is permissible for humans to sacrifice basic interests of nonhuman wildlife for the sake of nonbasic human interests, when "the human interests involved are so important that rational and factually informed people who have genuine respect for nature are not willing to relinquish the pursuit of those interests even when they take into account the undesirable consequences for wildlife" (p. 280). So much for the denial of human superiority! Taylor's theory fails-falls into contradiction-because of its individualism. A moral attitude which respects all living things must degenerate into an exceedingly complex casuistry, usually to the detriment of the natural environment. A successful environmental ethic will find value in nature as a whole, not merely in the individuals that comprise natural systems. Contains a good, but limited, bibliography. (Katz, Bibl # 1)

Taylor, Paul, "Are Humans Superior to Animals and Plants," Environmental Ethics 6(1984):149--160. An answer to the criticisms of Lombardi (see 1983). (Katz, Bibl # 1)

Taylor, Paul W. "Are Humans Superior to Animals and Plants?" Environmental Ethics 6(1984):149-60. Louis G. Lombardi's arguments in support of the claim that humans have greater inherent worth than other living things provide a clear account of how it is possible to conceive of the relation between humans and nonhumans in this way. Upon examining his arguments, however, it seems that he does not succeed in establishing any reason to believe that humans actually do have greater inherent worth than animals and plants. Taylor is in the philosophy department, Brooklyn College of the City University of New York, Brooklyn, NY. (EE)

Taylor, Paul W. "The Ethics of Respect for Nature." Environmental Ethics 3(1981):197-218. I present the foundational structure for a life-centered theory of environmental ethics. The structure consists of three interrelated components. First is the adopting of a certain ultimate moral attitude toward nature, which I call "respect for nature." Second is a belief system that constitutes a way of conceiving of the natural world and of our place in it. This belief system underlies and supports the attitude in a way that makes it an appropriate attitude to take toward the Earth's natural ecosystems and their life communities. Third is a system of moral rules and standards for guiding our treatment of those ecosystems and life communities, a set of normative principles which give concrete embodiment or expression to the attitude of respect for nature. The theory set forth and defended here is, I hold, structurally symmetrical with a theory of human ethics based on the principle of respect for persons. Taylor is in the philosophy department, Brooklyn College of the City University of New York, Brooklyn, NY. (EE)

Taylor, Peter J., and Buttler, Frederick H., "How Do We Know We Have Global Environmental Problems? Science and the Globalization of Environmental Discourse," Geoforum (UK) 23(no. 3, 1992):405-416. Science has a central role in shaping what count as environmental problems. This has

been evident most recently in the success of planetary science and environmental activism in stimulating awareness and discussion of global environmental problems. We advance three propositions about the special relationship between environmental science and politics: (1) in the formulation of science, not just in its application, certain courses of action are facilitated over others; (2) in global environmental discourse, moral and technocratic views of social action have been privileged; and (3) global environmental change, as science and movement ideology, is vulnerable to deconstructive pressures. These stem from different nations and differentiated social groups within nations having different interests in causing and alleviating environmental problems. We develop these propositions through a reconstruction of The Limits to Growth study of the early 1970's, make extensions to current studies of the human/social impacts of climate change, and review current sources of opposition to global and political formulations of environmental issues. Taylor is in science and technology studies, Cornell University, Ithaca; Buttel is in rural sociology, University of Wisconsin, Madison. (v.10,#1)

Tear, T. H. E. A., "How Much Is Enough? The Recurrent Problem of Setting Measurable Objectives in Conservation," Bioscience 55(no. 10, October 2005): 835-849. International agreements, environmental laws, resource management agencies, and environmental nongovernmental organizations all establish objectives that define what they hope to accomplish. Unfortunately, quantitative objectives in conservation are typically set without consistency and scientific rigor. As a result, conservationists are failing to provide credible answers to the question "How much is enough?" This is a serious problem

because objectives profoundly shape where and how limited conservation resources are spent, and help to create a shared vision for the future.

Teichman, Jenny, Social Ethics: A Student's Guide. Oxford: Blackwell Publishers, 1996. Part Two is "A Defence of Humanism," and within this Chapter 5 is "Human Beings and the Other Animals." Extremes are that only humans count and that all animals count equally. "Given that both forms of extremism are wrong we can say that there must be 'a queue of moral concern' (Mary Midgeley). Our problem is to arrange the queue. This is not an easy task. Placing human beings at the head of the queue is only the beginning; how are we to rank the apes and the dolphins and the whales and the tigers and our domestic pets? How much weight should we give to cultural factors? Won't our own human lives be seriously impoverished if we ignore cultural factors? Finally, it is agreed on all sides that our moral obligations belong to us because we are human. Is that itself a 'speciesist' theory? I shall have to leave these questions about the queue for readers to think about and answer if they can. But here is a final question. Is it because humanity is no more important than the other animals that we should be compassionate to them? Or is it because we are higher than they are?" Teichman is a Fellow of New Hall, Cambridge University.

Terborgh, John, "Reflections of a Scientist on the World Parks Congress," Conservation Biology 18(no.3, 2004):619-620. (v. 15, # 3)

Terborgh, John, Requiem for Nature. Washington, DC: Island Press, 1999. 234 pages. Some chapter titles: Paradise Fading; The Danger Within; Protecting Biodiversity; Preserving Biodiversity for Posterity; From Wildlands to Wasteland: Land Use and the Mirage of Sustainable Development; Why Conservation in the Tropics is Failing; Hard Choices in the Twenty-First Century; Nature, a Global Commons. Ecoprospecting and ecotourism are unlikely to help much, nor are "extractive reserves" where natives harvest nuts and resins. Nor is sustainable development, given the pressures of overpopulation and aggressive capitalism.

We should focus on "functional government that is capable of making things happen on the ground." The U.S. example of federal lands, abused though these often are, is as promising model as any for third-world nations--if and only if there is government with integrity. Further, parks and reserves will often need to be uninhabited, even areas that were long inhabited by indigenous peoples, since the modern ones have chainsaws and guns, and escalating numbers. "Nature can be saved, but only through a thoughtful combining of good science and strong institutions. Right now, much of the world benefits from neither. We have a long way to go before anyone can feel comfortable about the future of nature. And there is no time to lose in getting on with the journey." Terborgh is a tropical biologist and ornithologist at the Duke University Center for Tropical Conservation.

Reviewed by Bill McKibben, New York Review of Books 46 (no. 13, Aug. 12, 1999):44-45, who quarrels with Terborgh's exclusion of people from reserves, citing the Adirondack mountain park in New York, where he lives, as a better model. (v.10,#3)

Terborgh, John, "In the Company of Humans," Natural History 109(no. 4, May 2000):54-63. Animals that prefer the company of humans. "Sometimes wild animals are attracted to people. They seem to weigh the risks of association with us and conclude that under certain circumstances, hanging out with Homo sapiens is the safest thing to do." One example is a peccary that, injured, took up living near a research station in the Amazon, near Trail 1, a main thoroughfare. "Our peccary must have decided that the risk of consorting with humans was less than the one it faced by remaining alone in the forest. Perhaps it had noticed that the jaguar was seldom in the vicinity of the station. Whatever its reasoning, the huangana [peccary] was right. Its vigor and agility steadily improved until, one day, a herd of its species crossed Trail 1 and our peccary was gone." Terborgh is director, Center for Tropical Conservation, Duke University. (v.12,#3)

Terra Nova, vol. 2, no. 3, summer 1997 is a theme issue: Music from Nature. The many ways that music can reach and define nature. Among many contributions:

--Krause, Bernie, "What Does Western Music Have to Do with Nature?", pp. 109-114. Western music in general has very few ties to the natural world, whatever other excellences it has, and this is a shortcoming.

Krause is an audio artist, does sound design for Hollywood films, and records natural soundscapes for their preservation.

--Takemitsu, Toru, "Nature and Music," pp. 4-13. Takemitsu was a contemporary Japanese composer, died 1996. (v10,#4)

Terra Nova: Nature and Culture will begin quarterly publication by MIT Press starting January, 1996. The goal is to show how environmental issues are at the focus of the general cultural debate of our time. Contributions from philosophy, literature, history, anthropology, environmental studies, politics, activism, and the arts are encouraged. Terra Nova will be professional and refereed. Submissions should be rigorous but comprehensible, written for the generalist. David Rothenberg is the editor. Department of Social Science and Policy Studies, New Jersey Institute of Technology, University Heights, Newark, NJ 07102. Phone 201/596-3289. Fax 201/565-0586.

Terrie, Philip G., Contested Terrain: A New History of Nature and People in the Adirondacks. Syracuse, NY: The Adirondack Museum/Syracuse University Press, 1997. 223 pages. \$ 30 cloth. "I want to show that the history of the Adirondacks is a tale of contested terrain and to connect current conflicts to their historical, social, and cultural roots." Terrie wants "to bring to the dialogue certain groups, mainly the year-round residents, whose voice has been noticeably absent from most previous efforts to write Adirondack history."

Thero, Daniel P. "Rawls and Environmental Ethics: A Critical Examination of the Literature." Environmental Ethics 17(1995):93-106. The original position contractarian model of ethical reasoning put forth by John Rawls has been examined as a basis for an environmental ethic on three previous occasions in this journal and in Peter Wenz's *Environmental Justice*. In this article, I critically examine each of these treatments, analyzing the proposals offered and identifying their shortcomings. I find a total of seven different proposals in this literature for modifying Rawls' theory to augment its adequacy or as a ground environmental ethics. The diverse difficulties that arise in attempting to apply Rawls suggest the conclusion that Rawlsian ethics may not be a suitable foundation for an adequate long-term environmental ethics. Thero is in the department of philosophy, State University of New York, Albany. (EE)

Thiel, Jo, Land Communities, Land Ethics, and Private Land, M.A. thesis, Colorado State University, fall 2001. Three metaphysical views of land are analyzed: the market view, the mechanistic view, and the land community view. The land community view is most adequate and leads to a land ethic, with the goal of land health, distinguished from the pristine integrity of wild nature. Land health is the responsibility of private landowners as well as appropriate public policy. Land owners must envision themselves as members of three types of community in order correctly to pursue a land ethic: the ecosystemic community, the ethical community, and the social community. Thiel is now in a Ph.D. program with the University of Colorado, Denver, in public affairs, focusing on non-profit environmental organizations and their role in environmental policy. Holmes Rolston was the principal advisor. (v.12,#3)

Thiele, Leslie Paul. Environmentalism for a New Millennium: The Challenge of Coevolution. New York: Oxford University Press, 1999. 336 pp. \$28. Coevolutionary thought and action grounded in the interdependence of humans and nature in a global context. With the goal of sustainable development in mind, contemporary environmentalists argue that human livelihoods must be integrated into complex and evolving ecological systems. This affirmation of coevolutionary interdependence has brought coherence to an inherently diverse social movement. (v.10,#3)

Thiele, Leslie Paul. "Nature and Freedom: A Heideggerian Critique of Biocentric and Sociocentric Environmentalism." Environmental Ethics 17(1995):171-190. A reformulation of our understanding of freedom is required if we are adequately to confront the environmental crisis. Engaging the debate between biocentric ecologists and sociocentric ecologists, I argue that the biocentric effort to ascribe rights (negative liberty) to nature is misbegotten. In turn, I suggest that the sociocentric effort to seek ecological realignment through the extension of human reason (positive liberty) is equally problematic. Martin Heidegger, who rejects both "negative" and "positive" notions of liberty, offers an understanding

of human freedom that constitutes an ecologically attuned alternative. Thiele is in the department of political science, University of Florida. (EE)

Thingmount Working Paper Series on Philosophy and Conservation is a series jointly sponsored by the British Association of Nature Conservation and the Department of Philosophy at Lancaster University. The title, "Thingmount" recalls a Viking term for a flat-topped mound used as a place of assembly, examples of which are found in the English Lake district. Some titles: Kate Rawles and Alan Holland, "The Ethics of Conservation"; Gill Aitken, "Extinction"; Gill Aitken, "Rarity"; Alan Holland and John O'Neill, "The Integrity of Nature over Time"; Jane Howarth, "In Praise of Backyards"; and others. Contact: The Secretary--Thingmount, Department of Philosophy, Furness College, Lancaster University, Lancaster, LA1 4YG, UK. (v7,#2)

Thomas, Emyr Vaughan, "Rolston, Naturogenic Value and Genuine Biocentrism," Environmental Values 6(1997):355-360. ABSTRACT: Holmes Rolston III attempts to get us to recognise nature as an objectively independent valuational sphere with its own activity of defending value. But in inspiring our ...psychological joining (with) on-going planetary natural history... what his account ultimately does is assimilate nature to the human. For, on his account, we find value in nature through a recognition that something that goes on in us (namely, defending value) also occurs in the natural world. That, it is argued, is far from the authentically deep form of biocentrism that is implicitly his ideal. The real depth to a biocentric viewpoint is to be found through a route other than the one taken by Rolston. Moreover, it is a route that has nothing to do with advancing the idea of what I call a naturogenic value--a value generated by nature. Rather, it relates to seeing nature as other than the human (as illustrated with reference to Emerson), in a way that is genuinely unsullied by the claims of self which, in the case of human beings, are the most elemental supports for a species perspective. Directorate of Policy and Science, Countryside Council for Wales, Ffordd Penrhos, Bangor, LL57 2LQ, UK1. With reply by Rolston. (EV)

Thomas, Jack Ward., and Huke, Susan. "The Forest Service Approach to Healthy Ecosystems." Journal of Forestry 94, no.8 (1996): 14. (v7, #3)

Thomas, Jack Ward, "Restoring the Agency's Environmental Ethic," Inner Voice (Association of Forest Service Employee's for Environmental Ethics), vol. 6, no. 1 (January-February 1994). Jack Ward Thomas has recently been named chief of the U.S. Forest Service, replacing Dale Robertson, a highly symbolic replacement, since Thomas was a key figure in the spotted owl report, and Robertson, though in many ways a moderate, was too much associated with the timber cutting past. "In brief, a land ethic is nothing more than the acceptance of constraints on human treatment of land in the short term to ensure long-term preservation of the integrity, stability, and beauty of the biotic community." "Such interest in a land ethic on the part of land management professionals has, for whatever reason, trailed behind the demands of a highly vocal segment of the public around the world." "Without skilled and ethical practitioners of biopolitics in natural resource management, natural resources cannot be managed. Biological information is not derived through immaculate conception, and politics can as readily be ennobling as corrupting." "We live in an age of euphemisms, half truths, obfuscation, double-talk, and double think. ... Tell the truth, all the truth, all the time. It is the right thing, the healthy thing, the professional thing to do." "Questions about ethical behavior do not ordinarily come in the form of a clear-cut challenge to honor and courage." A longer article is in Joyce K. Berry and John C. Gordon, eds., Environmental Leadership (Washington, DC: Island Press, 1993). (v5,#1)

Thomas, Jack Ward and Burchfield, James, "Comments on "The Religion of Forestry: Scientific Management," Journal of Forestry 97(no. 11, Nov 01 1999):10- . Foresters strive to satisfy the objectives

of their employers and are accustomed to working within a political and social context. Civil discourse, informed by science, is the method for revolving inevitable conflicts over resource use. (v.11,#1)

Thomas, V. G. and Kevan, P. G., "Basic Principles of Agroecology and Sustainable Agriculture", Journal of Agricultural and Environmental Ethics 6(1993):1-20. In the final analysis, sustainable agriculture must derive from applied ecology, especially the principle of the regulation of the abundance and distribution of species (and secondly their activities) in space and time. Interspecific competition in natural ecosystems has its counterparts in agriculture, designed to divert greater amounts of energy, nutrients, and water into crops. Whereas natural ecosystems select for a diversity of species in communities, recent agriculture has minimized diversity in favour of vulnerable monocultures. Such systems show intrinsically less stability and resilience to perturbations. Thomas is in zoology at the College of Biological Science, University of Guelph, Ontario. Kevan is in environmental biology at Ontario Agricultural College, University of Guelph, Ontario.

Thomas, V. G., "The Environmental and Ethical Implications of Lead Shot Contamination of Rural Land in North America," Journal of Agricultural and Environmental Ethics 10(1997):41-54. Lead shot deposited in fields and woodlands near shooting ranges and intense, upland, hunting adds an enormous tonnage of lead to environments, worldwide. This contamination is not remedied by banning lead shot use only for waterfowl hunting. Lead pellets disintegrate extremely slowly, during which time they may be ingested from the soil by wild birds, livestock, or silage-making machinery, and cause sublethal or fatal lead poisoning. Lead pellet corrosion products contaminate soil, surface waters, and ground waters, often exceeding permissible levels. In heavily contaminated sites, earthworms ingest lead compounds which are bioaccumulated in higher consumers of food webs. Non-toxic substitutes made from steel or bismuth are available internationally, but nations are slow to require their use due to hunters and international sport shooting organizations opposing the use of non-toxic substitutes and overt emphasis by government agencies on the burden of scientific proof for every situation, rather than taking preventative action according to the Precautionary Principle. The ethical approach of Denmark and The Netherlands, which banned all uses of lead shot, is advocated as a precedent for other nations to adopt. (JAEE)

Thomas, Vernon G., "Attitudes and Issues Preventing Bans on Toxic Lead Shot and Sinkers in North America and Europe," Environmental Values 6(1997):185-200. ABSTRACT: It is paradoxical that lead shot and fishing sinkers are still used widely, given society's understanding of lead contamination and avian lead toxicosis. The statutory action taken by governments varies from total bans on both lead products to no regulation of either shot or sinkers. Many government agencies and field sport organisations are reluctant to use the precautionary principle and the polluter pays principle and regulate use of available non-toxic substitutes. The attitudes of individuals towards their roles in environmental lead contamination and remediation reflect marked self-deception about the need for changes and the benefits to be derived from substitution. Fatal lead poisoning of highly symbolic, revered species such as British mute swans and American bald eagles promoted development of national regulations to ban lead shot and fishing weights. Despite the parallels between these countries reforms, there has been little parity between the banning of lead shot and fishing sinkers. Department of Zoology College of Biological Science, University of Guelph, Guelph, Ontario, N1G 2W1, Canada. (EV)

Thompson, Adeyinka Christopher, Ethics in International Politics? The Contradictions and Ethical Implications of Foreign Aid in Africa, Ph.D. thesis, Michigan State University, 2000. Independence brought, for many African peoples, a return not only to repressive government, but also to economic decline and hardship. Some have blamed the international community--primarily the Western or developed nations. I make an ethical analysis of the relationship between African nations and the developed world--with specific reference to foreign aid. Normative questions are central to international relations; actors in international relations cannot but raise normative questions. There is an obligation for Western developed nations to assist poor under-developed Third world (in particular African) nations. A case study of aid to Somalia. Three key issues facing African nations--(1) what type of democracy is suitable; (b) corruption; and (c) compromising sovereignty by allowing intervention. This complexity reinforces the need for ethics in international politics. Without morality to evaluate our actions we will be unaware of what we are doing. The advisor was Martin Benjamin.

Thompson, Charis M., "Ranchers, Scientists, and Grass-roots Development in the United States and Kenya," Environmental Values 11(2002):303-326. Two initiatives in community-based biodiversity conservation are examined. I describe key aspects of the formation in the mid 1990s of the Malpai Borderlands Group of the Southwest US, and the reorganization of the Kenya Wildlife Service during 1994-6 and their legacies since then. I review how history, ownership, membership, and valuation were appealed to, created, maintained, and contested in defining what should be saved, by and for whom, and how in each. I also suggest the central role of science and relatively mundane technologies in coordinating these parameters. Success or "best practice" as applied to the conjunction of biodiversity conservation and development depends upon this work in contesting and establishing history, ownership, membership and valuation. Thompson, Janna, "A Refutation of Environmental Ethics," Environmental Ethics 12(1990):147-160. Environmental ethics as practiced by Taylor, Routley, and Rolston is a dead end. It is not a true ethic because it fails to provide a consistent account of value. The central problem is the level of value application---individuals, systems, etc. Thompson believes that any arguments for one kind of value entity can be applied to all entities, including parts of entities or machines. Thompson's alternative is a value based on sentience and point-of-view, but this position seems similarly arbitrary. (Katz, Bibl # 2)

Thompson, Janna. "Aesthetics and the Value of Nature." Environmental Ethics 17(1995):291-305. Like many environmental philosophers, I find the idea that the beauty of wildernesses makes them valuable in their own right and gives us a moral duty to preserve and protect them to be attractive. However, this appeal to aesthetic value encounters a number of serious problems. I argue that these problems can best be met and overcome by recognizing that the appreciation of natural environments and the appreciation of great works of arts are activities more similar than many people have supposed. Thompson is in philosophy, La Trobe University, Bundora, Victoria, Australia. (EE)

Thompson, Janna. "Towards a Green World Order: Environment and World Politics." Environmental Politics 4(Winter 1995):31

Thompson, Janna. "A Refutation of Environmental Ethics." Environmental Ethics 12(1990):147-60. An environmental ethic holds that some entities in nature or in natural states of affairs are intrinsically valuable. I argue that proposals for an environmental ethic either fail to satisfy requirements which any ethical system must satisfy to be an ethic or they fail to give us reason to suppose that the values they promote are intrinsic values. If my arguments are correct, then environmental ethics is not properly ethics at all. Thompson is in the philosophy department, La Trobe University, Victoria Australia. (EE)

- Thompson, Janna. "Environment as Cultural Heritage." Environmental Ethics 22(2000):241-258. Arguments for the preservation of natural objects and environments sometimes appeal to the value of those objects as cultural heritage. Can something be valuable because of its relation to the historical past? I examine and assess arguments for preservation based upon heritage value and defend the thesis that we have an obligation to appreciate what our predecessors valued and to value those things that have played an important role in our history. I show how this conception of our obligations can be used to defend the preservation of natural objects and environments including wilderness areas. (EE)

- Thompson, Paul B., "Ethics in Agricultural Research", Journal of Agricultural Ethics 1(1988):11-20. Utilitarian ethics provides a model for evaluating moral responsibility in agricultural research decisions according to the balance of cost and benefits accruing to the public at large. Given the traditions and special requirements of agricultural research planning, utilitarian theory is well adapted to serve as a starting point for evaluating these decisions, ut utilitarianism has defects that are well documented in the philosophical literature. Administrators who are sensitive to the strengths and weaknesses of utilitarian ethics are equipped to make a better allocation of research effort. Thompson is in agricultural economics at Texas A&M University, College Station.
- Thompson, Paul B., "Animals in the Agrarian Ideal", Journal of Agricultural and Environmental Ethics 6(1993). Thomas Jefferson, Ralph Waldo Emerson and other American intellectuals of the 18th and 19th century created an agrarian ideal for farming that stressed the formation of moral virtue, citizenship values and personal character. This agrarian ideal provides a contrast to utilitarian norms, which value farming in terms of efficiency in producing food commodities. Thus, while efficiency criteria might be used to justify production practices that minimize management costs in animal agriculture, the agrarian ideal instead stipulates a role relationship between humans and animals as the norm for evaluating a farmer's use of animals. An anecdotal account of the agrarian ideal in modern times is presented using

children's literature. Thompson is in the Center for Biotechnology Policy and Ethics, Institute for Biosciences and Technology, Department of Philosophy, Department of Agricultural Economics, Texas A&M University, College Station, TX 77843-4355.

Thompson, Paul B., "Food Biotechnology's Challenge to Cultural Integrity and Individual Consent," Hastings Center Report 27 (no. 4, July-August 1997):34-38. Consumer response to genetically altered foods has been mixed in the United States. While transgenic crops have entered the food supply with little comment, other foods, such as the bioengineered tomato, have caused considerable controversy. Objections to genetically engineered food are varied, ranging from the religious to the aesthetic. One need not endorse these concerns to conclude that food biotechnology violates procedural protections of consumer sovereignty and religious liberty. Consumer sovereignty, a principle especially valued in this country, requires that information be made available so each individual or group may make food choices based on their own values. As yet, there is no policy provision for informing consumers about the degree to which food has been genetically engineered. Thompson is in philosophy and agricultural economics at Texas A&M University. (v8,#3)

Thompson, Paul B., "Report of the NABC (National Agriculture Biotechnology Council) Ad-Hoc Committee on Ethics," Journal of Agricultural and Environmental Ethics 10(1997/1998):105-125. ABSTRACT. The National Agriculture Biotechnology Council appointed an ad-hoc subcommittee on ethics, March 1995. Their report: 1. Each NABC member institutions should ensure that subject matter on ethical issues associated with food and agricultural biotechnology is systematically integrated into the curriculum of their institution. The pattern of implementation will vary at each institution, but we expect that some combination of the following three strategies will be employed at most institutions.

- a) Modules Included in Basic and Applied Science Courses
 - b) Modules Included in General Courses on Applied Ethics
 - c) Special courses on Ethics and Food Biotechnology
2. Each NABC member institution should develop an institutional mechanism for supporting faculty interest and research on ethical issues. Again, implementation will vary. In some institutions, an informal network of interested colleagues will fulfill this function, but in many places an annual workshop or a formal faculty/center will be needed to carry this out.
 3. Each NABC institution should include information on ethical issues in its public education programs on biotechnology. Extension and public policy education materials should be developed and NABC institutions should actively disseminate materials on ethical issues beyond the campus.
 4. NABC should support these efforts of member institutions by sponsoring regular workshops or conferences on ethical issues, aiding in the development of modules and teaching materials, and aiding in the dissemination of materials in both printed and electronic form. In particular, NABC should support these efforts by raising funds from member institutions, from foundations and government agencies, and from the private sector, including commercial biotechnology companies. (JAEE)

Thompson, Paul B. "Ethical Issues in Livestock Cloning," Journal of Agricultural and Environmental Ethics 11(1999):197-217. Although cloning may eventually become an important technology for livestock production, four ethical issues must be addressed before the practice becomes widespread. First, researchers must establish that the procedure is not detrimental to the health or well-being of affected animals. Second, animal research institutions should evaluate the net social benefits to livestock producers by weighing the benefits to producers against the opportunity cost of research capacity lost to biomedical projects. Third, scientists should consider the indirect effects of cloning research on the larger ethical issues surrounding human cloning. Finally, the market structure for products of cloned animals should protect individual choice, and should recognize that many individuals find the prospect of cloning

(or consuming cloned animals) repugnant. Analysis of these four issues is complicated by spurious arguments alleging that cloning will have a negative impact on environment and genetic diversity. (JAEE)

Thompson, Paul B. "Uncertainty Arguments in Environmental Issues." Environmental Ethics 8(1986):59-75. A large part of environmental policy is based upon scientific studies of the likely health, safety, and ecological consequences of human actions and practices. These studies, however, are frequently vulnerable to epistemological and methodological criticisms which challenge their validity. Epistemological criticisms can be used in ethical and political philosophy arguments to challenge the applicability of scientific knowledge to environmental policy, and, in turn, to challenge the democratic basis of specific environmental policies themselves. Uncertainty arguments thus draw upon philosophy of science, epistemology, ethics, and political philosophy to establish conclusions of practical relevance to environmental quality. A theory of how and when uncertainty arguments ought to be given credence in environmental decision making requires an account of how scientific research ought to be integrated into environmental policy generally, plus an account of how public environmental policy is to be set in a democracy. Thompson is in the department of Agricultural Economics, Texas A & M University, College Station, TX. (EE)

Thompson, Paul B. "Conceptions of Property and the Biotechnology Debate." BioScience 45 (no. 4, April, 1995): 275-282. Philosophical concepts of property applied to biotechnology can help evaluate the relative strengths and weaknesses of arguments offered to justify alternative political positions. Two broad philosophical approaches to property are: (1) one in terms of rules to produce ethical goals such as social welfare or personal liberty, and (2) one that treats the property status of an entity as an ontological question. Natural law and labor theories are ontological approaches, the former influential in Europe. Protection through patents and copyrights has largely been defended on instrumental grounds, such as enhancing economic growth, especially in the United States. Thompson is in philosophy at Texas A & M University. (v6,#1)

Thompson, Paul B. "The Reshaping of Conventional Farming: A North American Perspective." Journal of Agricultural and Environmental Ethics 10(2001):217-229. Debates over the future of agriculture in North America establish a dialectical opposition between conventional, industrial agriculture and alternative, sustainable agriculture. This opposition has roots that extend back to the 18th century in the United States, but the debate has taken a number of surprising turns in the 20th century. Originally articulated as a philosophy of the left, industrial agriculture has utilitarian moral foundations. In the US and Canada, the articulation of an alternative to industrial agriculture has drawn upon three central themes: the belief that agriculture is, in some way, tied to democracy; the belief that complex bureaucratic organizations are inherently opposed to human interests; and the belief that the family farms characteristic of 19th century North America tend to produce people of superior moral character. It has proved difficult to weave these themes into a coherent vision of agriculture for the 21st century. Often, risk and health-based concerns are the basis for public criticism of conventional agriculture, but these do not conflict with the utilitarian orientation of the industrial model, and are easily incorporated into it. If there is to be a philosophical debate over the future of agriculture, we must find some way to rehabilitate the quasi-Aristotelean view of agriculture that emerges from the three critical themes noted above. Keywords: agrarianism, industrial agriculture, sustainable agriculture, US agricultural history, virtue ethics. Thompson is in Department of Philosophy, Purdue University, West Lafayette, IN. (JAEE)

- Thompson, Paul B., "Ethics and the Genetic Engineering of Food Animals," Journal of Agricultural and Environmental Ethics 10(1997):1-23. Biotechnology applied to traditional food animals raises ethical issues in three distinct categories. First are a series of issues that arise in the transformation of pigs, sheep, cattle, and other domesticated farm animals for purposes that deviate substantially from food production, including for xenotransplantation or production of pharmaceuticals. The second series of issues relate to animal welfare. The principle of welfare conservation prohibits dysfunctional genetic engineering of food animals, but would permit altering animal's biological functions, especially when to do so improves an individual animal's well being. - Thompson, Paul B., "Norton's *Sustainability* : Some Comments on Risk and Sustainability," *Journal of Agricultural and Environmental Ethics* 20(2007):375-386. Bryan Norton's 2005 book *Sustainability* describes a pragmatic approach to environmental philosophy that stresses philosophy's role as one of mediating between scientific and ordinary language. But on two topics, Norton's approach is not pragmatic enough. In the case of his discussion of risk, he accedes to a scientific notion that fails to acknowledge the way that ordinary usage of the word risk involves pragmatic links to human action and moral responsibility. With respect to the word sustainability, his analysis fails to acknowledge important scientific work that characterizes the functional integrity of system cycling, opting instead for usage grounded either in economic accounting or in an even less substantive sense of a broad social movement for environmental improvement. On each of these topics, adherence to the pragmatic orientation of Norton's philosophy results in a different analysis of the concepts in question.
- Thompson, Paul B., "The Agricultural Ethics of Biofuels: A First Look," *Journal of Agricultural and Environmental Ethics* 21(2008):183-198. A noticeable push toward using agricultural crops for ethanol production and for undertaking research to expand the range of possible biofuels began to dominate discussions of agricultural science and policy in the United States around 2005. This paper proposes two complementary philosophical approaches to examining the philosophical questions that should be posed in connection with this turn of events. One stresses a critique of underlying epistemological commitments in the scientific models being developed to determine the feasibility of various biofuels proposals. The second begins with a broader set of questions about the philosophical goals of agriculture, then queries the place that a turn to biofuels might have within the philosophy of agriculture. Both are portrayed as viable and important. The paper itself is a preliminary stage-setting reflection on the need for these two types of philosophical inquiry.

- Thompson, Paul B. "Should We Have GM Crops?" *Santa Clara Journal of International Law* Vol. 4, no. 1 (2006): 75-95. Thompson evaluates the title question by discussing consumer rights of exit with respect to consumption of GM crops, environmental risk from GM crops, and the effectiveness of the scientific community in addressing non-technical issues that have been raised by GM crops. Three key theses are argued: (1) U.S. labeling policy for GM crops provides only tenuous protection for consumers' ethical right to eat a diet that conforms to religious, cultural or politically based values; (2) environmental risks, though real, have been overstated by critics of GM crops, who have ignored significant environmental risks from non-GM agricultural technologies; and (3) although scientific bodies have done a credible job of addressing many technical issues on GM crops, their poor handling of human, social and other non-technical issues has tended to undermine public confidence in their willingness or ability to engage even the technical issues. As such, skepticism about GM crops is neither surprising nor entirely unjustified.

- Thompson, Richard P., "Compensated Takings and Negotiated Solutions," Journal of Forestry 91 (no. 4, April 1993):14-18. The author claims that increased regulations of what private landowners may and may not do on their forest lands amounts to partial takings, and finds that courts are increasingly recognizing this, although they still lean too much to extend police powers protecting from harm in environmental cases. There is a limited ability of regulatory law to impart respect and stewardship for natural resources; one cannot legislate morality. Landowners must be given incentive. One simple method is to compensate landowners for legitimate losses from takings due to environmental regulation. But one should also view landowners as partners with society in conservation and negotiate with them directly on mutual issues. - Thornhill, R., "Darwinian Aesthetics," pages 543-572 in C. Crawford and D. Krebs, eds., Handbook of Evolutionary Psychology (Mahway, NJ: L. Erlbaum, 1998). We are emotionally attracted to features of the physical and social environment that are likely to increase our fitness, which we experience as beautiful. (v.13,#4)
- Thornhill, Randy, "Darwinian Aesthetics." Pages 543-572 in Crawford, Charles, and Krebs, Dennis L., eds., Handbook of Evolutionary Psychology: Ideas, Issues, and Application. Mahwah, NJ: Lawrence Erlbaum, Associates, 1998. "Beauty is in the adaptations of the beholder" (p. 557). Humans aesthetically prefer in their natural environments what historically helped them to outreproduce other humans; but only scientists have been able to figure this out. "Beauty is the moving experience associated with information processing by aesthetic judgment adaptations when they perceive information of evolutionary historical promise of high reproductive success" (p. 557). "A beautiful thing is one that has high personal, evolutionary historical reproductive value, but this value is totally out of reach of introspection. Only the scientific method can identify the cues involved in aesthetic judgment and the evolutionary function of the judgment" (p. 557)
- "One can conclude with great confidence that beauty and ugliness were important feelings in the lives of the evolutionary ancestors of humans (i.e. those individuals who outreproduced others in human evolutionary history). The existence of human aesthetic value distinguished our evolutionary ancestors from the other individuals present in human evolutionary history who failed to reproduce or reproduced less. A beautiful idea of evolutionary psychology is that the discipline allows discovery of how human ancestors felt about various aspects of their environment; the discipline allows discovery of our emotional

roots" (p. 549). So the scientific truth is: the more biophilia, the more babies. Thornhill is in biology at the University of New Mexico, Albuquerque.

Thornton, Alex and McAuliffe, Katherine, "Teaching in Wild Meerkats," Science 313(2006):227-229. Teaching is ubiquitous in humans but has been difficult to demonstrate in animals. Most attempts to find it involve primates, with little or no clear success. A usual definition of teaching involves intent to teach and ideas passing from mind to mind, with teacher correcting pupil. These authors use a similar, but importantly different definition: "Teaching is characterized by the active involvement of experienced individuals in facilitating learning by naive conspecifics." (If so, a mother hen scratching, finding food, and calling her chicks to eat and imitate her is teaching). These authors find, interestingly, that wild meerkats (an African rodent) teach. Meerkats live in demanding environments and catch and eat scorpions (about 4.5% of what they eat). These scorpions have stingers on their tails that can kill meerkats; they also have harmful pincers. Adult meerkats will first kill scorpions and feed them to their young. When the young are older, they maim the scorpions and let the young catch them. It seems that the adults differentially maim the scorpions depending on the advancing skills of the juveniles. Adults remove the stinger for the naive young, but with more experienced young they do not. So they gradually introduce pups to live prey. The authors do not think this involves a theory of mind, but such "teaching can be based on simple mechanisms without the need for intentionality and the attribution of mental states." In fact, they think this kind of teaching may be present in ants. The authors are in zoology, Cambridge University.

Thornton, Joe, Pandora's Poison: Chlorine, Health, and a New Environmental Strategy. Cambridge, MA: The MIT Press, 2000. Global build-up of organochlorine pollution is already contributing to infertility, immune suppression, cancer, and development disorders in humans and wildlife. 1,000 references. - Thurston, Harry, "Last Look at Paradise?" (Galápagos Islands), International Wildlife 27(no. 3, May/June 1997):12-21. The primordial world of the Galápagos is under siege from people. In the past thirty years, the number of people who reside on the islands has risen seven-fold, putting pressures on the vulnerable wildlife. The government in Ecuador faces a tough battle trying to preserve the unique animals while responding to citizens' demands for an improved standard of living. Newcomers from the mainland have a gold-rush mentality that would exploit wildlife rather than protect it. Many disregard protection laws and are overfishing the islands' rich oceans. About 50,000 tourists come each year, but do little harm because Ecuador manages tourists closely. (v8,#2)
- Thurston, Harry, "When It Became a New Species, a Tiny Songbird Was Thrust into the Limelight," National Wildlife 36, no. 4, June/July 1998, pp. 18-19. Bicknell's thrush in New England has been declared a new bird species in a taxonomic revision by ornithologists. The bird, known since 1881, was previously classified a subspecies of the more widespread gray-cheeked thrush. Henri Ouellet, a researcher at the Canadian Museum of Nature (the thrush is also found in parts of Canada) discovered that the breeding and wintering ranges of the two thrushes do not overlap, the songs are decidedly different, and no interbreeding occurs. The decision has brought the bird into intense study, with conservation versus development implications. (v9,#2)
- Thwaites, Vivonne, "Karra: Karrawirraparri-river red gum-Eucalyptus camaldulensis," Ethics and the Environment 8(no. 1, 2003):51-60. Karra was a visual arts project devised for the 2000 Adelaide Festival in Australia. Its focus was the River Red Gum, quite justifiably an Australian icon, and once the most widespread tree in south eastern Australia. The project comprised an installation by three artists and a forty-page publication with essays and visual material from many contributors. The intention of the project (which I developed and oversaw as curator) was twofold. First, I hoped that an examination of the River Red Gum from a number of points of view might help people connect with the tree itself, and more broadly with this place non-Aboriginal Australians so uneasily inhabit. Second, given the tree's central place in Australia's inland waterways; I wanted the art to help people consider the urgent problems facing this ecosystem, such as increased salinity, diminished water flow and environmental degradation. This subject had particular relevance for South Australians, as our state is so dependent on the Murray-Darling River system. For example, in February 1999 the Commonwealth Scientific and Industrial Research Organisation published a media release on "Salt: Australia's Greatest Battle," declaring that we stand to lose a large fraction of our native biodiversity to salinity, and that native trees "remain the front line answer." Thwaites is a freelance curator in Adelaide, Australia. (E&E)

Tiberghien, Gilles, Land Art. New York: Princeton Architectural Press, 1995. 311 pages. ISBN 1-56898-040-X. Originally published in French, Éditions Carré, 1993 under ISBN 2-908393-18-2. A coffee table size and style book detailing earthworks, photographs, sketches, with accompanying text, interpretation, criticism. "In seeking to find new parameters that allow a definition of what art is, the Land Art artists have produced new objects. Their move away from museums and galleries is also a desire to reinvent art, in a certain sense. But moving away from these spaces is also extending them. ... In using earth as a medium and material, they have not attempted to make nature into a new museum, ... Land Art is not primarily an art of landscape. ... The earth, dirt, on the other hand, with its power of provocation (simply from the troubling effect of its presence) ... is what gives Land Art acts their radicalism. ... The deserts, the quarries, the abandoned mines, the distant plains, and the mountainous summits give us the sense of a world where art takes on a new meaning, where museums disappear, and humanity is eclipsed." For philosophical commentary, see Peter Humphrey, "The Ethics of Earthworks," Environmental Ethics 7(1985):5-21; Allen Carlson, "Is Environmental Art an Aesthetic Affront to Nature?", Canadian Journal of Philosophy 16(1986):635-50. Tickell, Crispin, "The Quality of Life: What Quality? Whose Life?" Environmental Values Vol.1 No.1(1992):65-76. ABSTRACT: As a consequence of industrialization, we face unprecedented pressures on the carrying capacity of the earth. Desertification, pollution and global climate changes can only increase these pressures, and will cause vast increases in the number of refugees and widespread risks to human health. Increasing inequalities between rich and poor nations are potential causes of conflict. Since the industrial countries are mainly responsible for our economic problems, they must give a lead in global arrangements to alleviate them. A major change in our habitual patterns of thought is essential, in which we reassess how we perceive values, and how we measure wealth and well-being. This must be accompanied by governmental action: on population numbers and the refugee problem; on the efficient use of energy; on new methods of land use, and on regulation of damaging industrial activities. To act in these ways, governments must reorganize their domestic policies and increase international co-operation. KEYWORDS: Climate change, economic values, environmental policy. "Most of us would like to find a secure home somewhere between uncritical nostalgia for the pristine wilderness that never was and those strands of social constructionism that deny the plausibility of any reference to reality apart from human interpretation" (p. 124) "Environmental thinking needs phenomenology, but also ... phenomenology needs environmental thinking, ... it requires the insights

inspired by our current ecological consciousness to revise its own methodological procedures." This requires a "naturalized phenomenology" (p. 125. Toadvine is in philosophy, Emporia State University, Emporia, KS.

Toadvine, Ted. "Limits of the Flesh: The Role of Reflection in David Abram's Ecophenomenology." Environmental Ethics 27 (2005):155-170. David Abram's The Spell of the Sensuous: Perception and Language in a More-Than-Human-World convincingly demonstrates the contribution that phenomenology, especially the work of Maurice Merleau-Ponty, can make to environmental theory. But Abram's account suffers from several limitations that are explored here. First, although Abram intends to develop an "organic" account of thinking as grounded in the sensible world, his descriptions castigate reflection and reverse, rather than rethinking, the traditional hierarchy between mind and body. Second, Abram's emphasis on perceptual reciprocity as the basis for an environmental ethic underplays the importance of the symbolic level of our interaction with others. Merleau-Ponty's later work, in particular his account of the reversibility of flesh, offers a fruitful alternative to Abram's methodology. (EE)

Tober, James A., Who Owns the Wildlife?: The Political Economy of Conservation in Nineteenth-century America. Westport, Conn: Greenwood Press, 1981. 330 pages. Especially concerned with the fact that wildlife has never been owned by private landowners, also tensions between state and federal management of wildlife.

Tobias, Michael, ed., Deep Ecology. San Diego, Avant Books, 1985. Pp. viii, 295. This book gives the Deep Ecology movement a bad name. The central problem of the Deep Ecology movement is its lack of a specific program or ideology. It remains a hodgepodge of Eastern religions, ecological science, process philosophy, feminism, and any other radical critique of Western technological thought. This book throws together several poor philosophy essays--often by nonphilosophers--with works of anthropology, fiction, poetry, and personal reminiscence. Of some interest is George Sessions, "Ecological Consciousness and Paradigm Change," (pp. 28-44) which is a distillation of some of his book on Deep Ecology. Also Arne Naess, "Identification as a Source of Deep Ecological Attitudes," (pp. 256-270), in which he argues for an expanded vision of the self--but he admits that his view rests on an intuition, not an argument (p. 266). Garrett Hardin's article, "Discriminating Altruisms" (pp. 182-205) is the best paper in the book. Hardin argues for a limited "self-interested" altruism based on biological kinship. It is symptomatic of the Deep Ecology movement (and of this collection) that Hardin's essay appears here--he is not a proponent of Deep Ecology. (Katz, Bibl # 1)

Todd Anne Marie, "The Aesthetic Turn in Green Marketing: Environmental Consumer Ethics of Natural Personal Care Products," Ethics and the Environment 9(no. 2, 2004):86-102. Green consumerism is on the rise in America, but its environmental effects are contested. Does green marketing contribute to the greening of American consciousness, or does it encourage corporate greenwashing? This tenuous ethical position means that eco-marketers must carefully frame their environmental products in a way that appeals to consumers with environmental ethics and buyers who consider natural products as well as conventional items. Thus, eco-marketing constructs a complicated ethical identity for the green consumer. Environmentally aware individuals are already guided by their personal ethics. In trying to attract new consumers, environmentally minded businesses attach an aesthetic quality to environmental goods. In an era where environmentalism is increasingly hip, what are the implications for an environmental ethics infused with a sense of aesthetics?

Todd, Helen and Christos Zografos, "Justice for the Environment: Developing a Set of Indicators of Environmental Justice for Scotland," Environmental Values 14(2005):483-501. This paper explores the context of environmental justice (EJ) in Scotland, and presents a case study whereby the main attributes for an indicator of EJ were identified, encompassing procedural and distributive aspects of justice. Through a participatory process, weights were assigned using a Multi-Criteria Analysis tool, the Analytical Hierarchy Process (AHP). Results show that overall, environmental injustices are mostly associated by respondents to unequal distribution of health burdens due to pollution, yet greater weight is attached to procedural justice by community environmental activists. The paper suggests that AHP may be applied to many situations and could form a basis for the development of tools to address and deliver EJ in Scotland. Todd is based in Edinburgh and Zografos is with the Land Economy Research Group, Scottish Agricultural College, Edinburgh. (EV)

- Tol, Richard S.J., "Why Worry About Climate Change? A Research Agenda," *Environmental Values* 17(2008):437-470. Estimates of the marginal damage costs of carbon dioxide emissions suggest that, although climate change is a problem and some emission reduction is justified, very stringent abatement does not pass the cost-benefit test. However, current estimates of the economic impact of climate change are incomplete. Some of the missing impacts are likely to be positive and others negative, but overall the uncertainty seems to concentrate on the downside risks and current estimates of the damage costs may have a negative bias. The research effort on the economic impacts of climate change is minute and lacks diversity. This field of study should be strengthened, with a particular focus on the quantification of uncertainties; estimating missing impacts, estimating impacts in developing countries; interactions between impacts and higher-order effects; the valuation of biodiversity loss; the implications of extreme climate scenarios and violent conflict; and climate change in the very long term. I discuss these particular gaps in research, and speculate on possible sign and size of the impacts of climate change.

- Toman, Michael, "Values in the Economics of Climate Change," *Environmental Values* 15(2006):365-379. Economics has played an important role in assessing climate change impacts, and the effects of various individual and policy response strategies. Proponents of a key role for economics in analysis of climate change policies and goals argue that its capacity to incorporate and compare a variety of costs and benefits makes it uniquely useful for normative assessment. Critics of economic analysis of climate change have questioned not only its empirical capacities, but also its fundamental usefulness given some of the important but often implicit assumptions on which it is based. After reviewing this debate and its implications for public policy on climate change, the paper sketches a way in which more technical economic analysis and public dialogue might be combined. (EV)

- Tomassi, Paul, "On the Metaphysics of Informed Environmental Concern," American Philosophical Quarterly 40(no. 4, 2003):333-343. "The main aim of this paper is to show that the metaphysical questions which bear upon environmental thinking are equally as 'classical' in character as those which bear upon any other area of discourse." "The issue here is not merely the nature of environmental concern but the nature of the metaphysical grounds which could underpin such concern." "One traditional metaphysical dispute which prima facie is likely to impinge upon environmental concern [is] realism vs. anti-realism." "Informed environmental concern is consistent with much stronger, more robustly metaphysical, realist positions." "The kinds of intuitions which most naturally lend themselves to explaining the forward-looking character of informed environmental concern are consistent with scientific realism but inconsistent with scientific anti-realism." "If environmental concern does involve objective modal elements then it seems likely that only realism will be adequate to providing an account of the metaphysical grounds underpinning such concern." "It would appear that the questions of environmental philosophy do indeed have properly metaphysical teeth." Tomassi is at the University of Aberdeen. (v. 15, # 3)

- Torgerson, Douglas, "The Paradox of Environmental Ethics." Alternatives Vol. 12, no. 2 (Winter 1985):26-36. The paradox is that man is at once dethroned from his supreme position in the hierarchy of nature, but he still remains the valuer, the judge of environmental morality. A look at the metaethical basis of environmental ethics, based on a new conception of reason and value as developed by the theory of

communicative ethics. (Katz, Bibl # 1)

Torgerson, Douglas, "The Paradox of Environmental Ethics," Alternatives (Faculty of Environmental Studies, University of Waterloo, Ontario) 12 (no. 2, Winter 1985):26-36. The paradox of environmental ethics is that it de-centers the human and, at the same time, places humanity at the center of things. Grouped together in social artifice, people typically take for granted their peculiarly human world. Ecological sensitivity would involve a transformation in the human perception of nature. Environmental ethics is possible, but it remains all-too-human. Torgerson teaches policy studies at Trent University, Peterborough, Ontario.

A huge anthology, 1,224 pages. Children's stories; tribal ritual and myth, aboriginal peoples, the Hebrew Bible, Mesopotamia, India, China, Japan, Classical Greece, the Hellenistic World and Rome, Late Antiquity and the Middle Ages, the Renaissance, the Scientific Revolution, the Enlightenment, 17th and 18th century British thought. Ends at the turn of the 19th century. Three thousand years of "nature writing." Torrance teaches comparative literature at the University of California, Davis, and is a founding member of the Nature and Culture Program there. (v.10,#3)

Torres, Bob. *Making a Killing: The Political Economy of Animal Rights*. Oakland: AK Press, 2007. Torres uses Marxist political economy, social anarchist theory, and an abolitionist approach to animal rights to examine the intersections between animal and human oppressions in relation to the exploitative dynamics of capitalism. He argues that we need to simultaneously fight animal exploitation and capitalism and that social justice movements for people must also take stock of domination, hierarchy, and power in human-animal relationships to liberate both people and animals.

Torres, Gerald. "Taking and Giving: Police Power, Public Value, and Private Right." Environmental Law 26, no.1 (1996): 1. A discussion of the relationship between property as a social artifact and law, and why this relationship is misunderstood. The political and narrative techniques used by property rights advocates and the current state of takings jurisprudence. Torres voices strong concern regarding the political and social values at stake in the struggle to define "property rights."

Tovey, Hilary, "Theorising Nature and Society in Sociology: The Invisibility of Animals," Sociologia Ruralis (European Society for Rural Sociology) 43(no. 3, 2003):196-215. Despite an increasing intellectual and social interest in the animals question in recent decades, animals remain largely invisible in social science texts. Even in environmental sociology texts, animals figure largely as biodiversity or wild species. Sociology tends to absorb animals into wild nature with virtually nothing to say about the huge numbers of domestic, service, or function animals; and it tends to recognize animals only in the form of generic types, without individual character or experience. In rural life, animals, especially domestic animals, are central to human society in a range of ways. Relations between farms and their animals are important for the formation of farmer identity and local farming culture. Animals are a key element in rural-urban relationships. Rural sociology needs to start developing its own approach to including animals in theorising society. Tovey is in sociology, Trinity College, Dublin.

Towery, Twyman L., The Wisdom of the Wolves: Nature's Way to Organizational Success. Franklin, TN: Wessex House Publishing (P. O. Box 681753, Franklin, TN 37068-1753). The wolves as a moral tutor, or at least as a provocative symbol. So much for the big bad wolf! The wolf credo: Respect the elders. Teach the young. Cooperate with the pack. Play when you can. Hunt when you must. Rest in between. Share your affections. Voice your feelings. Leave your mark. The strength of the wolf is the pack, and the strength of the pack is the wolf. First there was the woman who runs with the wolves, and now, for the men, maybe women too, there is the wisdom of the wolves. Twyman is a Nashville, Tennessee, counseling psychologist and organizational management consultant. (v7,#1)

Towner, W. Sibley, "The Future of Nature" Interpretation: A Journal of Bible and Theology 50 (no. 1, January 1996):27-35). Bible and biology agree: Human beings cast the biggest shadow over the future of nature. At the end of the millennium we face a choice: We can continue to overuse and exploit our ecosphere or we can exercise tender "dominion" in the world, as God's agents here.

Townley, Cynthia, "Intellectual Property and Indigenous Knowledge," Philosophy and Public Policy Quarterly 22 (no. 4, Fall 2002):21-26. Westerners see indigenous knowledge as property to be obtained and used as a commodity. Indigenous peoples are more likely to see knowledge as a gift. But receiving such a gift involves respect for the giving persons and traditions, not just treating the knowledge as a commodity separable from the givers. Townley is in philosophy, University of Nevada at Las Vegas.

Trainor, Sarah Fleisher, "Realms of Value: Conflicting Natural Resource Values and Incommensurability," Environmental Values 15(2006): 3-29. Divergent values are often at the heart of natural resource conflict. Using discord over the Grand Staircase-Escalante National Monument in southern Utah, U.S.A. as a case study, I propose that values are perceived as incommensurate because they reflect different realms, with which there exist distinct concepts of what it means to value and distinct, irreducible forms of value expression. I further argue that collaborative, discursive processes are one way to account for plural values in policy and decision making without requiring a common metric, yet they are not without theoretical and practical challenges. Treanor, Brian. "Narrative Environmental Virtue Ethics: Phronesis without a Phronimos." *Environmental Ethics* 30(2008):361-379. It is increasingly clear that virtue ethics has an important role to play in *Environmental Ethics*. However, virtue ethics—which has always been characterized by a degree of ambiguity—is faced with substantial challenges in the contemporary “postmodern” cultural milieu. Among these challenges is the lure of relativism. Most virtue ethics depend upon some view of the good life; however, today there is no unambiguous, easily agreed-upon account of the good life. Rather, we are presented with a bewildering variety of conflicting accounts of the good life. Narrative—in particular Paul Ricoeur’s account of narrative identity—has much to contribute to virtue ethics, including resources that can help us respond to the challenges presented by the postmodern context. Narrative constitutes an “ethical laboratory” by providing us with an “as if” experience through which we can try out various ethical alternatives. Two sorts of environmental narratives, working in concert, further help to limit relativist objections: (1) narratives of environmental survival (which identify dispositions, such as simplicity, necessary for our long-term survival) and (2) narratives of environmental flourishing (which make a virtue of necessity by pointing out those dispositions necessary for our survival often contribute to our flourishing beyond mere survival). (EE)

Trefil, James, Human Nature: A Blueprint for Managing the Earth--by People, for People. New York: Times Books/Henry Holt Co., 2004. Trefil is concerned about the state of the Earth, but only for the sake of people. His bottom line, often repeated, is that the global ecosystem should be managed for the benefit of humans. Forget about caring for animals, plants, species, or ecosystems for any good of their own, or intrinsic values. If we like them, they are ours to keep. If we don't like them, who cares if they vanish. We might even need to get them out of our way. Trefil has an optimistic view of the power of technology to transform the Earth into a more useful place for us humans. Trefil is a physicist at George Mason University. Reviewed by Michael Ruse, "My World, and Welcome to It," New York Times Book Review, July 4, 2004, p. 22. (v. 15, # 3)

Trefil, James, "Modeling Earth's Future Climate Requires both Science and Guesswork," Smithsonian, Dec. 1990. "Predictions of global warming, catastrophic or otherwise, depend on both what we do know and our assumptions about what we don't. I have seen a piece of the 21st century and I don't like it very much. We are going to face serious problems, and we will have to face them while the scientific evidence for the seriousness (and even the existence) of the problems is clouded by doubt and controversy. Worse, the aspects of scientific knowledge presented to the public will appear contradictory and ambiguous, and will give us little on which to make our decisions." Useful article, readable by undergraduates, and sets the stage for discussion of the ethical puzzles of decisions made on incomplete scientific knowledge, probabilities, involuntary risks, and so on. James Trefil is a well-known physicist and author at George Mason University. (v1,#4)

Trefil, James S., Are We Unique: A Scientist Explores the Unparalleled Intelligence of the Human Mind. New York: Wiley, 1997. 242 pp. Trefil claims that animal minds are not only different in degree of

intelligence but in the kinds of consciousness they are capable of. Also, despite the achievements of computer designers, no computer of any kind will ever be able to replicate the human intelligence. Trefil teaches physics at George Mason University and is science commentator for National Public Radio. (v8,#2)

Minneapolis, MN: Milkweed Editions (430 First Avenue North, Suite 400, Minneapolis, MN 55401), 1996. ISBN 1-57131-212-0. \$ 6.96. 115 pages. Originally created and presented as a limited edition to Congress, as an effort to communicate through literary art the urgent need to preserve threatened lands. Literature for a land ethic. The historical and spiritual importance of

public lands, and how, if we value wilderness, we must take action to preserve it. Selections from William Kittredge, Barry Lopez, John McPhee, Scott Momaday, Margaret E. Murie, Gary Paul Nabhan, T. H. Watkins, Charles Wilkinson, Terry Tempest Williams, Ann Zwinger, and others. "If writing itself can be an act of public service, then this collection is it." - Bill Bradley, U. S. Senator.

Troesken, Werner. *The Great Lead Water Pipe Disaster*. Cambridge, MA: MIT Press, 2006. In the early 1900s, drinking water contaminated by lead pipes was the main source of human-ingested lead in the U.S. and Europe, bringing illness and death to millions of people. In areas where the waters were corrosive, such as Massachusetts and northern England, tap water contained a hundred times more lead than modern standards allow. This work surveys the discovery of this problem, unheeded evidence, disputed links, social factors leading to denial of the problem, court compounded problems about who was responsible, and political neglect. A well-intended change in water treatment and supply had the undesired consequences of increasing the water contamination. There could be lessons for contemporary environmentalism. Troesken's book is reviewed by Rebecca Renner in "Plumb Crazy," *Science* Vol. 315, no. 5819 (23 March 2007): 1669.

Trombulak, Stephen C., "How to Design an Ecological Reserve System," paper published by Wild Earth, 1997. \$ 5.00 from Wild Earth, P. O. Box 455, Richmond, VT 05477. Detailed guidance for nonscientists on how to design science-based ecological reserves. Trombulak teaches biology and environmental science at Middlebury College, Vermont. (v8,#3)

Tropical Resources Institute, The, Yale School of Forestry and Environmental Studies, publishes a newsletter, Tri News, with short articles reporting conservation issues, usually by their Ph.D. candidates who are working internationally. For example: Vasant Saberwal, "Lion-Human Conflicts in the Gir Forest and Adjoining Areas (a Wildlife Sanctuary and National Park in India)" in the Spring 1991 issue. There were 70 human injuries and 16 deaths in the last year in this area, much escalated from previous years. Part of the problem is baiting lions for tourist viewing, which decreases lion wariness; part of the problem is compassionate feeding and medically assisting old or wounded animals, rather than letting them starve, again decreasing lion wariness. Saberwal concludes that lions need to be culled and hunted to make them more wary. Tropical Resources Institute, Yale School of Forestry and Environmental Studies, 205 Prospect Street, New Haven, CT 06511. (v2,#2)

Troster, Lawrence. "The Mountain and the River Valley: Environmentalism as the Foundation of Dialogue between Civilizations." *Earth Letter* (Spring 2007) 8-9. In a speech given in Tehran, Iran, a rabbi argues that the environment is a universal human crisis that demands a universal human response, and is an issue on which people of all faiths can and must start a dialogue.

Troyer, James R., Nature's Champion: B. W. Wells, Tar Heel Ecologist. Chapel Hill, NC: University of North Carolina Press, 1993. B. W. Wells (1884-1978) was a pioneering ecologist at then North Carolina State College (now University), through whom thousands of North Carolinians learned to appreciate and protect nature, long before ecology and conservation became popular causes. Troyer teaches biology at North Carolina State University. (v7,#1)

Trudgill, Stephen, "Psychobiogeography: Meanings of Nature and Motivations for a Democratized Conservation Ethic," Journal of Biogeography 28(2001):677-698. The language of ecosystem science is pervaded by value-laden terms such as pristine, fragile, disturbance, balance, dominance and alien

species. Such terms have high status and are often used in the rhetoric of the conservation ethic. Here, I consider the possibility of the use of less value-laden terms such as change, increase, decrease and so on. This would distinguish between values and perceived trends or states and leave ecosystem science to deal with what is verifiable. However, I also consider the opposite point of view, in that the value-laden terms, like "the balance of nature", relate to how a wide range of people feel about nature and are effective emotive motivators of the conservation ethic in society, providing a common language for a discourse between ecosystem scientists and other people. Trudgill teaches biogeography, Department of Geography, Cambridge University. (v.13, #3)

Trudgill, Steve, The Terrestrial Biosphere: Environmental Change, Ecosystem Science, Attitudes, and Values. Harlow, UK: Pearson Education/Prentice Hall, 2001. A British humanistic geographer's effort to blend nature and culture, science and values. A repeated theme is that "ecosystems are renewable but not repeatable" so "if we can't improve predictability, we have to increase adaptability" (p. ix). We need "ecology for people." "'The Greens' have often used an evangelical zeal which doesn't work as it alienates many people; it would be better to try for a 'win-win' where ecology is for people in a combined ecological, economic and social justice context" (p. 3).

Trudgill accentuates social constructions. "One might say that reality is defined by our concepts of reality or even that illusion is the only reality. If this is so, then it is important to examine our constructs and concepts, as this book attempts to do, because our concepts about ecosystems act to influence the way we treat the world and indeed the way we imagine and manage the terrestrial biosphere... 'A man looks at reality and brings to it his own limitations' [quoting Steinbeck]. In other words, our concepts both facilitate and limit our outlook" (p. 21).

"Science has a great deal to contribute in the simpler, mechanical, verifiable systems, but in the 'loose', less tangible and unverifiable constructions like ecosystem and landscape, science is a foundation but it has little to offer in the sense that it can't decide what views people will hold and how they will act" (p. 41). "Nature conservation should perhaps be re-named species conservation, habitat conservation, diversity conservation, or even preferred state conservation, because it does not seem to be much about conserving nature, that is leaving nature to get on with itself" (p. 130)." In result, Trudgill takes a dim view of wilderness conservation; 'wilderness is a concept as much as a place. His outlook much better fits the British landscape. "Green spaces in cities and gardens are the 'acceptable' face of nature, involving elements of (therapeutic) involvement but with control of nature" (p. 105).

Trudgill is in Biogeography and Environmental Management, Department of Geography, Cambridge University. (v.13, #3)

Trueheart, Charles, "Canal Plan in France Stranded," Washington Post (7/30/97): A18. Planned French canal would link the North Sea with the Mediterranean. A 143-miles long canal with 15 dams, 24 locks and hundreds of bridges would link the Rhine River that flows to the North Sea with the Saone and Rhone Rivers that flow South into the Mediterranean. Promoted for nearly 40 years by the French government, the canal would be three times as long as the Panama Canal and would cut some villages in two with 25-foot dikes. Local politicians who supported the canal were recently thrown out of office and replaced with canal opponents. While the French government buys up land in the path of the canal, locals split ownership of the land to make it more difficult to acquire or expropriate. One member of anti-canal forces said that if the project is not killed, "We are ready to fight. This canal would make us terrorists." (v8,#3)

- Tucker, Gene M. "Rain on a Land Where No One Lives: The Hebrew Bible on the Environment." Journal of Biblical Literature 116, no. 1 (Spring 1997): 3-17. This is the Presidential Address delivered 23 November 1996 at the Annual Meeting of the Society of Biblical Literature in New Orleans, Louisiana.

The article is exegetical and in response to the deluge of materials resulting from Lynn White's "The Historical Roots of Our Ecological Crisis." Tucker's footnotes to that literature are especially helpful. Tucker concludes that the biblical texts, as with all biblical interpretation, contain both problems and possibilities. All of the Hebrew traditions assume that human beings are both in and of the world, and that humans have a distinctive place in creation. Some texts attack hierarchical structures, and some emphasize humankind's identification with the rest of the world. Their distinction is that humans are "the ones addressed by God (Job) or speak to God (Psalm 104)" (p. 16). Tucker is Prof. of Hebrew Bible at Emory University, Atlanta, GA. (v8,#2)

Tudge, C., Last Animals at the Zoo: How Mass Extinction Can be Stopped. Washington, DC: Island Press, 1992.

Tudge, C., "The Rise and Fall of Homo sapiens sapiens," Philosophical Transactions of the Royal Society, London, B 325 (1989):479-488. Human beings have broken the ecological 'law' that says that big, predatory animals are rare. Two crucial innovations have enabled us to alter the planet to suit ourselves and thus permit unparalleled expansion: speech and agriculture. However, natural selection has not equipped humans with a long-term sense of self-preservation. Our population cannot continue to expand at its present rate for much longer, and the examples of many other species suggest that expansion can end in catastrophic collapse. Survival beyond the next century in a tolerable state seems most unlikely unless all religions and economies begin to take account of the facts of biology. If this occurred, it would be a step in cultural evolution that would compare in import with the birth of agriculture. "I take it also to be self-evident that ours is not the only important species; that other creatures have a 'right' to occupy this planet, and that we at times have to bow to their needs, even at cost to ourselves." Tullock, Gordon, The Economics of Non-Human Societies. Tucson, AZ: Pallas Press, 1994. 87 pages. The author offers a general theory of "bioeconomics" encompassing both human and non-human societies. His strategy is to apply to non-human societies the tools that have developed in economics. Specifically, the behavior of the social insects can be thought of as the interaction of preference functions and the environmental consequences of individual behavior. Insects have their preferences instinctively, but are selected for reciprocal cooperation doing what is in the self-interest of each. An "invisible hand" naturally selects the most efficient hive. Humans have their preferences with options in choice but act in their self-interests; Adam Smith's "invisible hand" selects for economic efficiency. From this, Tullock develops a theory that, in principle, is capable, he claims, of predicting whether a given species will survive in a particular niche. Nevertheless, he adds, "I do not think that studying the non-human societies is of help to the student of human societies" (p. 83). For a review see Clarence C. Morrison, "The Economics of Non-Human Societies," Atlantic Economic Journal 23(1995):318-322. Tullock is an economist at the University of Arizona known for his application of economic theory to problems in political science. (v7,#1)

Turner, Derek D., "Are We at War with Nature?" Environmental Values 14(2005): 21-36. A number of people, from William James to Dave Foreman and Vandana Shiva, have suggested that humans are at war with nature. Moreover, the analogy with warfare figures in at least one important argument for strategic monkeywrenching. In general, an analogy can be used for purposes of (1) justification; (2) persuasion; or (3) as a tool for generating novel hypotheses and recommendations. This paper argues that the analogy with warfare should not be used for justificatory or rhetorical purposes, but that it may nevertheless have a legitimate heuristic role to play in environmental philosophy. Turner is in philosophy, Connecticut College, New London, CT. (EV)

Turner, Derek D., "Monkeywrenching, Perverse Incentives and Ecodefence," Environmental Values 15(2006): 213-232. By focusing too narrowly on consequentialist arguments for ecosabotage, environmental philosophers such as Michael Martin (1990) and Thomas Young (2001) have tended to overlook two important facts about monkeywrenching. First, advocates of monkeywrenching see sabotage above all as a technique for counteracting perverse economic incentives. Second, their main argument for monkeywrenching - which I will call the ecodefence argument - is not consequentialist at all. After calling attention to these two under-appreciated aspects of monkeywrenching, I go on to offer a critique of the ecodefence argument. Finally, I show that there is also a tension between the use of cost/benefit analysis to justify particular acts of ecosabotage and the clandestine nature of those acts. (EV)

Turner, Derek and Lauren Hartzell "The Lack of Clarity in the Precautionary Principle," Environmental Values 13(2004):449-460. The precautionary principle states, roughly, that it is better to take precautionary measures now than to deal with serious harms to the environment or human health later on. This paper builds on the work of Neil A. Manson in order to show that the precautionary principle, in all of its forms, is fraught with vagueness and ambiguity. We examine the version of the precautionary principle that was formulated at the Wingspread Conference sponsored by the Science and Environmental Health Network in 1998. That version fails to indicate who must bear the cost of precaution; what constitutes a threat of harm; how much precaution is too much; and what should be done when environmental concerns and concern for human health pull in different directions. Whether this vagueness is a strength or weakness of the principle, depends on what purpose(s) the precautionary principle is supposed to serve. Turner is in philosophy Connecticut College, New London, CT. Hartzell is in philosophy, Stanford University, Stanford, CA. (EV)

Turner, Frederick, Rebirth of Value: Meditations on Beauty, Ecology, Religion and Education (Albany: SUNY Press, 1991). 188 pages. \$ 12.95 paper. A holistic approach, with an emphasis on universalism. The common features of myths and works of art the world over militate against relativistic, historicist interpretations of culture. The experience of beauty is a feedback from nature. Turner is professor of arts and humanities at the University of Texas at Dallas. (v2,#2)

Twentieth-Century America," Environmental History 7(no.3, 2002): 462-84. (v.13,#4)

Turner, Jack, The Abstract Wild. Tucson: University of Arizona Press, 1996. 136 pages. Turner takes on the mantle of cantankerous iconoclast, reminiscent of Edward Abbey. The issue of wildness versus domestication is the central issue for the future of both humans and nonhumans on Earth. The central trouble is the human desire for management and control. Our relationship with the nonhuman world must be a spiritual one. The nonessential manipulation and management of wild ecosystems by biologists and others is unacceptable. Wildlife biologists introducing wolves to Yellowstone, with collars on the wolves, tracking them on the internet, are instances of this management mentality; these are not wild wolves at all. Most outdoor recreation is superficial and destructive, resulting from human desires use wilderness for their recreational pleasures.

The dominant economic paradigm must be marginalized for the good of both humans and nonhumans. Commercializing everything, including the natural environment, merely feeds into the paradigm that's causing the problem. "We must examine processes at the heart of modernity that are only vaguely understood, however pernicious their consequences for the wild earth, processes that not only destroy the wild but diminish our experience of the wild" (p. xiii). "What we need now is a culture that deeply loves the wild earth" (p. xvii). Turner lives in a remote ranch on the Mexican border during the winter and in Grand Teton National Park in the summer, where he is a mountain guide. He once taught philosophy at the University of Illinois. But he now finds of little importance "the byzantine world of environmental philosophy -- (one of the) elements, I believe, of 'shallow' ecology" (p. xv). He has a book on the Tetons, published by Henry Holt.

There is an interview with Turner in Wild Duck Review (Nevada City, CA), December 1996, and a discussion in the February 1997 issue, including a response by George Sessions, particularly to Turner's claim that deep ecology contains no first rate thinkers (although Turner concedes that Arne Naess influenced him greatly, enough to persuade him to leave philosophy, p. xv). Sessions also speaks to Turner's intense dislike of management in conservation biology. (v.9,#3)

Turner, R. Kerry, Button, Kenneth, and Nijkamp, Peter, eds. Ecosystems and Nature: Economics, Science and Policy. Cheltenham, Gloucester, UK: Edward Elgar Publishing Co., 1999. 38 articles. Not cheap: £\$125.00, \$ 205.00. Brings together the work of leading authorities in biodiversity research. Provides readers with a broad interdisciplinary perspective on major issues in biodiversity, including economics, natural science, management and ethics. Part I introduces some fundamental scientific and socio-economic concepts and analysis in order to illustrate the complexities involve. Part II deals with the valuation of ecosystems with special emphasis on the main biomes, wetlands, marine systems, grasslands and agriculture. Part III covers the problem of value appropriation and the relevant constraints and available policy instruments. Part IV focuses on the difficult ethical issues that surround use and conservation of biodiversity. Contributors include:

Turnhout, Esther, Matthijs Hisschemöller and Herman Eijsackers, "The Role of Views of Nature in Dutch Nature Conservation: The Case of the Creation of a Drift Sand Area in the Hoge Veluwe National Park," Environmental Values 13(2004):187-198. Nature conservation requires choices about what sort of nature should be protected in what areas and includes value judgments on what nature is and/or should be. This paper studies the role of differing views of nature in nature conservation. A case study on the creation of a drift sand area in the Netherlands illustrates how nature conservation disputes can be understood as a conflict in views of nature. The authors are in earth and life sciences, Institute of Ecological Science, Vrije Universiteit, Amsterdam. (EV)

Turpin, Jennifer and Lois Ann Lorentzen, eds., The Gendered New World Order: Militarism, the Environment, and Development. New York: Routledge, 1996. 264 pages, Hardback and paper. Ecological security seems increasingly precarious and battles over land and models of economic development now lead to military conflicts. This volume addresses the compelling issue of how gender connects the global problems of militarism, underdevelopment, and environmental decay. Scholars from around the world make connections between such seemingly disparate issues as refugees, polluted waters, bombed villages, massive dam projects, starving children, deforestation, nuclear arms buildup, and the rights of women. (v7, #3)

Turton, David, "The Mursai and National Park Development in the Lower Omo Valley." Pages 169-186 in Anderson, David and Grove, Richard, eds. Conservation in Africa: People, Policies and Practice. Cambridge: Cambridge University Press, 1989. The Mursai people, in Ethiopia, are wedged in between the Omo and Mago National parks and have negative effects on the wildlife in the parks. Some argue that they should be relocated to form a larger national park.

Tweeten, Luther, "The Costs and Benefits of bGH Will Be Distributed Fairly," Journal of Agricultural and Environmental Ethics 4(1991):108-120. In a debate, with others arguing the contrary.

Tweeten, Luther, "Public Policy Decisions for Farm Animal Welfare", Journal of Agricultural and Environmental Ethics 6(1993). The highly divergent attitudes of people in the United States regarding animal welfare versus human welfare inhibit formulation and legislative approval of a consensus policy. The lack of consensus is a matter both of divergent values and of inadequate knowledge. This paper makes a case that the policy process presents a major hurdle to animal rights proponents because the agricultural committees through which legislation must pass are controlled by legislators favourable to producers' interests. This report briefly reviews animal welfare policies in the U.S. The conclusion is

that animal welfare legislation has been rather freely extended to transport, slaughter, and experimentation but has not yet been extended to animals on farms. Many recommendations made by animal welfare advocates are consistent with conventional standards of good farm management and profit. At issue is to what extent these recommendations should be made legally enforceable mandatory rules. It is important to separate potential animal welfare reform into two categories: (1) legislation which is economically profitable to producers; and (2) legislation which is economically unprofitable. The former ordinarily will not require the force of law, since a program of education by the Cooperative Extension Service, other agencies, and the media ordinarily will suffice. Tweeten is in the Department of Agricultural Economics and Rural Sociology, The Ohio State University, 228 Agricultural Administration Building, Columbus, OH. 43210-1066.

Twine, Richard T., "Ma(r)king Essence--Ecofeminism and Embodiment," Ethics and the Environment 6(no. 2, 2001):31-58. Ecofeminism can consolidate its tradition of elucidating the interconnections between different oppressions by expanding upon its philosophy of the body. By looking at the ways in which particular bodies become 'marked', and so devalued, ecofeminism can point towards various unexpected and creative coalitions. Here I concentrate especially upon two intertwined sets of markings, namely those related to aesthetic discourses and those related to discourses of Western reason. I argue that both of these ultimately revolve around notions of control of the body as being constitutive of Western ideas of human identity. Moreover, I want to affirm that those ideas which encourage us to devalue certain bodies stem from discourses related to nature and animality. Through considering how ecofeminism might re-think embodiment, I argue for an alternative conception which stresses the inherent vulnerability and agency of human embodiment. Twine is finishing a Ph.D. in sociology, Manchester Metropolitan University, UK. (E&E)

Geneva: United Nations Environmental Program - Environment and Trade, # 6, 1994. 116 pp. An overview of the history of the Montreal Protocol on Substances that Deplete the Ozone Layer, the necessity and effectiveness of the Protocol's trade measures, and the measures for consistency with the trade rules of the General Agreement on Trade and Tariffs. The monograph also examines possible mechanisms for settling disputes which may arise as a result of the interpretation and implementation of the Protocol's trade measures. (v8,#2)

Tybirk, K, H. F. Alroe, and P. Frederiksen, "Nature Quality in Organic Farming: A Conceptual Analysis of Considerations and Criteria in a European Context," Journal of Agricultural and Environmental Ethics 17(2004):249-274. Nature quality in relation to farming is a complex field. It involves different traditions and interests, different views of what nature is, and of valuing nature. Furthermore there is a general lack of empirical data on many aspects of nature quality in the farmed landscape. In this paper we discuss nature quality from the perspective of organic farming, which has its own values and goals in relation to nature - the "Ecologist View of Nature." This is in contrast to "Culturist View" characteristic of much conventional agriculture and the "Naturalist View" characteristic of the traditional biological approach to nature quality. This

threefold distinction forms a framework for exploration of nature quality criteria in the farmed landscape. The traditional work on nature quality has mainly focussed on biological interests based on a Naturalist View of Nature. In this paper we will explore how criteria for nature quality based on the Ecologist View

can be developed and thereby feed into the ongoing discussion of the development of the organic farming practices. We suggest additional criteria for nature quality based on an Ecologist View of Nature: biodiversity, habitat diversity, extent and structure, functional integrity of habitats and agro-ecosystems, landscape integrity, accessibility, and experientiality. The larger set of Naturalist and Ecologist criteria can provide a wider and more balanced basis for developing nature quality indicators that are relevant in the farmed landscapes. This broader approach to nature quality is also expected to benefit the general societal discussions and decisions on farming and nature. Keywords: accessibility, aesthetics, agriculture, biodiversity, biological integrity, conservation, functional integrity, habitat, landscape, view of nature. Tybirk is with the National Environmental Research Institute, Department of Wildlife Ecology and Biodiversity, Denmark. Alroe is at the Danish Research Centre for Organic Farming, Tjele, Denmark. Fredericksen is at the National Environmental Research Institute, Department of Policy Analysis, Roskilde, Denmark. (JAEE)

Theology and Science is the new journal of the Center for Theology and Natural Science, Graduate Theological Union, Berkeley. Ecosystem science offers opportunities for reconciling science and religion. Conflicts between science and religion revolve about fundamental assumptions more than they do facts or theories. The key postulates that have guided science since the Enlightenment (particularly the determinism and reductionism) appear to be wholly inadequate to describe the development of ecosystems (which are more open and holistic). An emended set of tenets adequate to the ecological narrative also significantly ameliorates the adversarial nature of the dialogue between scientists and theists. Thoughtful account by a well-known ecologist. Ulanowicz is at the University of Maryland Center for Environmental Science. (v.14, #4)

Ulfelder, Jay. "Natural-Resource Wealth and the Survival of Autocracy." *Comparative Political Studies* Vol. 40, no. 8 (2007): 995-1018. Does natural-resource wealth impede transitions to democracy? This article revisits this question with an event history design that differs from the approach used in other recent statistical tests of rentier state theory. The research confirms that autocracy is typically more durable in countries with substantial resource wealth, and the author finds this effect is robust to other measures proposed to explain the dearth of democracy in the Middle East or the Muslim world.

United Kingdom. Some notes on environmental philosophy in the United Kingdom are in the ISEE Newsletter, vol. 4, no. 3, Fall 1993.

United Nations Commission on Human Rights, Human Rights and the Environment. Document E/CN.4/Sub.2/1994/9. July 6, 1994. 92 pages. This is the final report from a four-year study on human rights and the environment to the U.N. Subcommission on Prevention of Discrimination and Protection of Minorities, a subcommission of the UN Commission on Human Rights, to which subcommission this assignment was delegated. The report was prepared by special rapporteur Fatma Zohra Ksentini and discusses the many ways in which environmental degradation interferes with the enjoyment of recognized human rights and confirms widespread legal recognition of this linkage. The report asks the Commission to appoint authorized persons to monitor situations that involve human rights and the environment, though the Commission has stopped short of doing so, asking for further comment by governments and NGO's. The document is also available in French and Spanish. Of some interest is Annex III, which summarizes constitutional provisions relative to environmental protection in over sixty nations. A U.S. contact monitoring these developments is the Sierra Club Legal Defense Fund, 180 Montgomery St., Suite 1400, San Francisco, CA 94104-4209. (v6,#4)

Honeywell is being ordered by New York state authorities to dredge Onondaga Lake, because of mercury pollution there (and other toxics) going back to pollution caused by Allied Chemical, since merged with Honeywell. Estimated cost \$ 448 million. But the cleanup standards are less stringent than would be imposed by the Environmental Protection Agency, which might cost \$ 2.3 billion. (v.14, #4)

Uriarte, Maria, Holly A. Ewing, Valerie T. Eviner, and Kathleen C. Weathers. "Constructing a Broader and More Inclusive Value System in Science." BioScience Vol. 57, no. 1 (2007): 71-8. A scientific culture that welcomes a diversity of participants and addresses a broad range of questions is critical to the success of the scientific enterprise and essential for engaging the public in science. By favoring behaviors and practices that result in a narrow set of outcomes, our current scientific culture may lower the diversity of the scientific workforce, limit the range and relevance of scientific pursuits, and restrict the scope of interdisciplinary collaboration and public engagement. The scientific community will reach its full intellectual potential and secure public support through thorough, multi-tiered initiatives that aim to change individual and institutional behaviors, shift current reward structures to reflect a wider set of values, and explicitly consider societal benefits in the establishment of research agendas. We discuss some shortcomings and costs of the current value system and provide some guidelines for the development of initiatives that transcend such limitations.

- Vaaarst, Mette, Lis Alban, Lisbeth Mogensen, Stig Milan, Thamsborg and Erik Steen Kristensen. "Health and Welfare in Danish Dairy Cattle in the Transition to Organic Production: Problems, Priorities and Perspectives." Journal of Agricultural and Environmental Ethics 10(2001):367-390. During the past few years, organic dairy farming has grown dramatically in Denmark. Consequently, an increasing number of people are encountering this method of production for the first time. Amongst these, many veterinarians have suddenly had to deal with organic herds in their home district, and, meeting examples of poor animal welfare, they have recently started to express some concerns. Against this background, a so-called "Synthesis of Knowledge" project was initiated to examine the health and welfare of dairy cattle and the use of medication in the transition to organic production. The aim of the project was to investigate associated problems from the point of view of the dairy herd. Based on qualitative research interviews with vets and agricultural advisors, as well as focus group interviews with farmers who had recently converted from conventional to organic farming, an expert panel attempted

to identify problem areas and possible solutions. The problems related to (a) the adjustment to new and unknown practices, (b) poor management in general, and (c) inappropriate legislation for organic farming.

One problem area was the rearing of dairy calves, particularly with regard to the establishment of postpartum relationships between cow and calf, group housing, and the grazing of young animals. A "natural life" was identified as being fundamental to organic animal husbandry. In terms of animal welfare, this concept can be understood as a way of living in which the calf is allowed to express its natural behavior and satisfy its natural needs. Essentially, the conditions needed for good calf welfare require the compatibility and interplay of elements from "nature" (the natural life; including opportunities to satisfy natural needs) and "culture" (farmer management skills; exercise of care). These elements should be balanced to ensure animal welfare in organic herds. Keywords: animal welfare, conversion, dairy calves, natural, organic dairy farming. The authors are in the Department for Animal Health and Welfare Danish Institute of Agricultural, Sciences Research Centre, Foulum, Tjele, Netherlands. (JAEE)

Vacation Trends." The Christian Science Monitor 89 (11 July 1997): 10-11. Interesting statistics on vacationing. "Outdoors" accounts for 17%, of which 85% is camping; "State/National Parks," 10%. Travel is a \$460 billion industry in the U.S., the third largest. Americans will make 230 million trips this summer. (v8,#2)

Vadnjaj, Dan, and O'Connor, Martin, "What is the Value of Rangitoto Island?" Environmental Values 3(1994):369-380. Contingent Valuation has been promoted as a catch-all approach to environmental valuation. While there have been numerous attempts in recent years to place monetary values on environmental amenities, studies have often reported a high frequency of protest, zero, or inordinately large dollar-value responses. This paper reports on the results of a survey designed to obtain information on how people actually interpret questions of paying to avoid changes in their views of Rangitoto Island. Evidence suggests that the meaning respondents attach to the actual dollar values they offer or bid are inconsistent with the conventional logic that underlies Contingent Valuation. Instead, respondents might be seen to be expressing views about how things ought to be in society, and that is simply not right to develop Rangitoto Island. Vadnjaj is at Darwin College,

Cambridge. O'Connor is in the Department of Economics, University of Auckland, New Zealand. (EV)

Vale, Thomas, "The Myth of the Humanized Landscape: An Example from Yosemite National Park, " Wild Earth 9(no. 3, Fall 1999):34- .

Vale, Thomas, "The Myth of the Humanized Landscape: An Example from Yosemite National Park," Natural Areas Journal 18(1998):231-236. "The once-popular view that the United States before European settlement was a 'pristine' natural landscape has been largely replaced by the view that the precontact landscape was 'humanized' by native peoples. While having merit, the contemporary emphasis on ubiquitous human agency is overstated: large parts of the United States, particularly in the American West, may have been essentially natural, their landscapes characterized by processes of nature rather than

people. Yosemite National Park is used here as an example to illustrate this point. The desire to visualize humanized landscapes in the pre-European era derives from social ideologies, rather than from careful assessment of ecological facts. Furthermore, those ideologies also monolithically stigmatize wilderness enthusiasm as superficial. The model of the pristine landscape has merit--its applicability in any given locale being an empirically testable proposition--and it should serve as a guide for management of natural areas" (Abstract, p. 231). In the Yosemite case, based on ecological and archaeological evidence, "even given the most generous interpretation of what was 'humanized,' much of the park was 'natural'--in the sense that its landscape characteristics were determined by natural processes" (p. 234). Vale is in geography, University of Wisconsin. van Bogaert, Louis-Jacques, "Sentience and Moral Standing," South African Journal of Philosophy 23(no. 3, 2004):292-301. Sentience is often used in the advocacy of animal rights and welfare, but sentience is not a simple but a complex phenomenon and requires closer analysis. Sentience is more than feeling pleasure and pain and pain is an inborn protection required to fit into the world rather than the substance of evil. Various accounts of the nature of sentience. Sentience is often altered or reduced by advocates to fit the argument. Sentience comes across a spectrum and in degrees. The emphasis on pain in sentience leads to misunderstanding. The paper also addresses issues in abortion. van Bogaert is in philosophy, University of Stellenbosch, South Africa.

van Wensveen, Louke, "Attunement: An Ecological Spin on the Virtue of Temperance," Philosophy in the Contemporary World 8 (Number 2, Fall-Winter 2001):67-78. Within an environmental virtue ethic belongs moderation for the sake of ecojustice. Named attunement, this virtue both resembles and differs from Aristotelian and Thomistic articulations of temperance. Principally expressed as frugality and moderation in diet, it includes: sensitivity to limits, acceptance of limits, joyous contentment, creativity, and readiness to sacrifice. Van Wensveen is in the Department of Theological Studies, Loyola Marymount University, Los Angeles. (v.13,#2)

Van de Pitte, M. M. "'The Female is Somewhat Duller': The Construction of the Sexes in Ornithological Literature." Environmental Ethics 20(1998):23-39. I review ornithological literature in order to demonstrate that conventions of description and illustration, as well as some aspects of biological theory relating to birds, put a strong focus on male birds. I criticize the sexist aspects of ornithology from the standpoint of recent feminist philosophy of science, establishing connections between the ways in which we view animals and the ways in which we view ourselves and arguing that it is costly to humans, specifically women, to suggest that females of the nonhuman species are biologically inadequate in relation to their male counterparts. Finally, I note that failure to notice and excise residual sexism in animal science also encourages people to be inattentive to and less considerate of a large and significant part of nature. I conclude with some suggestions for reform. Van de Pitte is in Philosophy, University of Alberta, Edmonton. (EE)

Van Den Bergh, JCJM; Rietveld, P, "Reconsidering the Limits to World Population: Meta-analysis and Meta-prediction", BioScience 54 (no.3, 2004): 195-204(10). We performed a meta-analysis on the basis of 69 past studies that have assessed a limit to the world population. The estimates of this limit range from 0.5 billion to 1 x 10²¹ billion people. A meta-analysis allows us to see what overall picture emerges when different methods, limiting factors, levels of aggregation, and data are taken into account. Limiting factors for the world population include water availability, energy, carbon, forest products, nonrenewable resources, heat removal, photosynthetic capacity, and the availability of land for food production. Methods employed in the population studies include spatial extrapolation, modeling of multiple regions, temporal extrapolation, actual supply of a resource, hypothetical modeling, and dynamic systems modeling. Many studies rely on important assumptions about the level of technology, the energy intake per person, and the available arable land. The meta-analysis employs both descriptive statistics and regression analysis. We used the findings of these analyses to propose a number of meta-estimates of limits to world population. When taking all studies into account, the best point estimate is 7.7 billion people; the lower and upper bounds, given current technology, are 0.65 billion and 98 billion people, respectively. We offer a range of other conditional estimates as well. An important conclusion of this study is that recent predictions of stabilized world population levels for 2050 exceed several of our meta-estimates of a world population limit.

Van Til, Kent A. *Two Dollars a Day: A Christian View of World Poverty*. Grand Rapids, MI: Wm. B. Eerdmans, 2007. We cannot assume that the free market will provide basic sustenance for all. The problem with the free market is that it distributes goods on only one basis: desert. You get what you earn, or you get what you can pay for. Most goods should be exchanged via the free market, but the justice of the marketplace is not sufficient. To argue against every form of redistribution of goods based on justice and benevolence is to ignore both history and the reality of power. Van Til is in religion at Hope College, Holland, MI.

Van Wensveen, Louke, Dirty Virtues: The Emergence of Ecological Virtue Ethics. Prometheus Books, 2000. Careful attempt to marry environmental ethics and virtue ethics. Van Wensveen argues that there already exists a flourishing "virtue language" among environmental writers and activists. Her book attempts to describe this discourse and clarify its logic of justification. Particularly interesting is the way such an ecological virtue ethics ("EVE") both builds on and challenges traditional notions of virtue. Separate chapters focus on Murray Bookchin and Thomas Berry, representing two very different attempts to develop an EVE. Aristotelian, Thomistic and feminist perspectives on virtue are thoroughly canvassed. Van Wensveen insists that any viable ecological virtue ethics must be non-anthropocentric: human flourishing and non-human flourishing must both be taken into account in our actions. Indeed, these cannot be separated, since flourishing ecosystems provide the physical, intellectual and spiritual resources for true human flourishing.

Van Wensveen insists that any viable ecological virtue ethics must be non-anthropocentric: human flourishing and non-human flourishing must both be taken into account in our actions. Indeed, these cannot be separated, since flourishing ecosystems provide the physical, intellectual and spiritual resources for true human flourishing. (v.11,#1)

VanBueren (Van Bueren), Edith T. Lammerts and Paul C. Struik, "Integrity and Rights of Plants: Ethical Notions in Organic Plant Breeding and Propagation," Journal of Agricultural and Environmental Ethics 18(2005):479-493. Organic farming acknowledges the integrity of plants as an essential element of its natural approaches to crop production. For cultivated plants, integrity refers to their inherent nature, wholeness, completeness, species-specific characteristics, and their being in balance with their (organically farmed) environment, while accomplishing their natural aim. We argue that this integrity of plants has ethical value, distinguishing integrity of life, plant-typic integrity, genotypic integrity, and phenotypic integrity. We have developed qualitative criteria to ethically evaluate existing practices and have applied these criteria to assess whether current plant breeding and propagation techniques violate the integrity of crop plants. This process has resulted in a design of a holistic, scientific approach of organic plant breeding and seed production.

Our evaluation has met considerable criticism from mainstream crop scientists. We respond to the following questions: (1). Can ethics be incorporated into objective crop sciences? (2). What is the nature of the intrinsic value of plants in organic farming? We argue that criteria to take integrity into account can only be assessed from a holistic perspective and we show that a holistic approach is needed to design such ethical notions in a consistent way. Key words: integrity - intrinsic value - natural aim - naturalness - organic breeding - organic plant propagation - plant rights - respect. Van Bueren is at the Louis Bolk

Institute, Driebergen, LA, The Netherlands. Struik is with the Plant Sciences Group, Crop and Weed Ecology, Wageningen University, Wageningen, The Netherlands. (JAEE)

vanBuren (van Buren), John. "Critical Environmental Hermeneutics." Environmental Ethics 17(1995):259-275. Local, national, and international conflicts over the use of forests between logging companies, governments, environmentalists, native peoples, local residents, recreationalists, and others--e.g., the controversy over the spotted owl in the old-growth forests of the Northwestern United States and over the rain forests in South America--have shown the need for philosophical reflection to help clarify the basic issues involved. Joining other philosophers who are addressing this problem, my own response takes the form of a sketch of the rough outlines of a critical environmental hermeneutics. I apply hermeneutics, narrative theory, and critical theory to environmental ethics, and use this hermeneutical theory as a method to illuminate the "deep" underlying issues relating to the perception and use of forests. In applying this method, I first take up the analytical problem of identifying, clarifying, and ordering the different interpretive narratives about forests in terms of the underlying epistemological, ethical, and political issues involved. I then address the critical problem of deciding conflicts between these different interpretations of forests by working out a set of legitimation criteria to which all parties concerned would ideally be able to subscribe. van Buren is in the philosophy department, Fordham University. vandenBELT (van den Belt), Henk, and Gremmen, Bart, "Between Precautionary Principle and "Sound Science": Distributing the Burdens of Proof," Journal of Agricultural and Environmental Ethics 15(no. 1, 2002):103-122. Opponents of biotechnology often invoke the Precautionary Principle to advance their cause, whereas biotech enthusiasts prefer to appeal to "sound science." Public authorities are still groping for a useful definition. A crucial issue in this debate is the distribution of the burden of proof among the parties favoring and opposing certain technological developments. Indeed, the debate on the significance and scope of the Precautionary Principle can be fruitfully re-framed as a debate on the proper division of burdens of proof. In this article, we attempt to arrive at a more refined way of thinking about this problem in order to escape from the existing polarization of views between "guilty until proven innocent" and "innocent until proven guilty." This way of thinking also enables a critical review of current demarcations between risk assessment and risk management, or science and politics, and of the morally laden controversy on the relative importance of type-I and type-II errors in statistical testing. KEY WORDS: biotechnology, burden of proof, Precautionary Principle, type-1 and type-II errors. The authors are with Applied Philosophy, Wageningen, Netherlaqnds. (JAEE)

VandenBorn (van den Born), Riyan J.G., "Rethinking Nature: Public Visions in the Netherlands," This study addresses two questions: (1) what visions of nature do lay people subscribe to? (2) to what extent do these visions reflect those of professional philosophers? Four philosophical images of the human-nature relationship were discussed with respondents; Master, Steward, Partner and Participant. Respondents recognise these images, but prefer to construct their own. Elements of their images are (1) that humans are part of nature, but (2) that they are responsible for nature as well. This study indicates that empirical philosophy can contribute to the further development of environmental philosophy. Through an empirical

turn we can discover people's own voice.

Vanderheiden, Steve. "Two Shades of Green: Food and Environmental Sustainability." Environmental Ethics 28(2006):129-145. The politics of food illustrates an enduring tension within environmental ethics and green political theory: the oft-assumed division between those thinkers for whom humanitarian goals remain prominent but who situate them within a normative framework stressing environmental sustainability and those thinkers who reject any distinctively humanitarian interests as untenably anthropocentric. In posing the problem as a moral dilemma between feeding people and saving nature, light and dark green value theories are made to appear in stark contrast, with the former prescribing the delivery of food aid to relieve hunger-related suffering, and the latter rejecting that call. This supposed dilemma between feeding people and saving nature is a false one. The real problem is a moral elitism on the part of developed countries where an insidious form of selfishness overemphasizes the role of population and obscures the roles of highly variable rates of consumption upon current environmental ills. An examination of the exemplary case of food politics shows that the exaggerated differences in policy implications of these two value theories can be diminished and that there is potential for common cause. (EE)

Vanderheiden, Steve. "Rousseau, Cronon, and the Wilderness Idea." William Cronon has recently argued that the current debate concerning justifications for protecting wilderness relies upon conceptions of natural value premised upon a nature/society dualism that originated in older nature writing but which still animates contemporary thinking. This dualism, he argues, prevents adequate realization of the human and social places in nature, and is ultimately counterproductive to the task of articulating the proper relationship between humans and the natural world. While the origin of one of these conceptions of natural value (the frontier) can be traced back to Rousseau, I argue that Rousseau's writings reveal a far more complex and nuanced treatment of the value of nature in and for society (and the persons that compose it) than has thus far been acknowledged. Moreover, by unpacking several arguments made by Rousseau on behalf of the stewardship and accessibility of natural areas, one can not only gain a more accurate view of Rousseau's environmental thought than is ordinarily recognized by authors who focus on his primitivism and anti-modern critique, but also some insights that may help bridge the nature/society dualism plaguing contemporary environmental ethics and noted by Cronon. Press, 2008. Vanderheiden addresses the challenge of mitigating climate change via conceptual frameworks of equality, justice, and responsibility. He discusses how climate change raises issues of international and intergenerational environmental justice by expanding on the work of John Rawls, and he argues that climate change policy can offer insights into resolving contemporary controversies within political theory.

vanderHeijden (van der Heijden), Hein-Anton, "Ecological Restoration, Environmentalism and the Dutch Politics of 'New Nature'," Environmental Values 14(2005):427-446. 'New nature' refers to the current practice in which ten thousands of hectares of superfluous agricultural lands are 'given back to nature', compensating for the loss of 'old nature' in other parts of the Netherlands. Around the issue of 'new nature' two discourses have emerged. In each discourse different environmental values are emphasised: about what nature is or could be; about the relationship between nature, agriculture and development; about ecological mitigation, and so on. Whereas the Dutch branch of WWF is the most active promoter of the sectorial nature development discourse, environmental groups like Friends of the Earth try to weigh these sectorial interests against the background of increasing environmental degradation. van der Heijden is in political science, University of Amsterdam, The Netherlands. vanderSteen (van der Steen), Wim J. "The Demise of Monism and Pluralism in Environmental Ethics." Environmental Ethics 17(1995):209-220. Peter Wenz has recently distinguished various forms of moral pluralism in an effort to dissolve the controversy over monism and pluralism. I argue that the distinctions are not really helpful once the methodology and the substance of science are brought to bear on ethics. Theories in ethics and science alike are subject to context-dependent methodological trade-offs. Hence, the category of theories should be heterogeneous. Monism and pluralism are at cross-purposes since they endorse different unanalyzed notions of theory. Awareness of heterogeneity among theories is helpful in dismissing the controversy. van der Steen is in biology, Free University, Amsterdam. (EE)

VanDeVeer, Donald, "Interspecific Justice," Inquiry 22(1979):55-79. What treatment of animals is morally acceptable cannot be decided in any straightforward way by appeals to equal consideration of interests or to animal rights. One must survey a variety of proposals as to how we ought to adjudicate interspecific conflicts of interests--proposals that are both "speciesist" and "non-speciesist." A proposal is here

defended as the most reasonable: two-factor egalitarianism, which incorporates (1) the level of importance (basic or peripheral) to each being in a conflict of interests, and (2) the psychological capacities of the parties whose interests conflict. This view is compared with the views of Tom Regan and Peter Singer. The view provides a non-anthropocentric basis for discounting the interests of sentient animals. VandeVeer is in philosophy at North Carolina State University.

VanDeVeer, Donald, and Pierce, Christine, The Environmental Ethics and Policy Book. Wadsworth, 1998. Second edition. The editors have incorporated numerous suggestions from instructors using the book. The revision is significant. There are 29 new readings and new sections on Future Generations, Sustainability, and Corporate Responsibility. New "Sidelights" include: Obstacles to Reasoned Discussion, On Mt. Mitchell, Overpopulation or Over Consumption, Let's Transform the Military, A Resistance Movement of One's Own. Also new are an internet environmental resources section, glossary, and a geological timechart. This edition is in paperback and hopefully not as expensive as other Wadsworth titles. The editors are in philosophy at North Carolina State University. (v8,#2)

VanDeVeer, Donald, and Pierce, Christine, eds., The Environmental Ethics and Policy Book: Philosophy, Ecology, Economics. 3rd ed. (Belmont, CA: Thomson-Wadsworth, 2003). The third edition of a long popular classroom anthology, which features the interaction between environmental ethics and policy. New topics in the third edition include: marine environmental ethics, genetically modified foods, transgenic organisms, the impact of fast food production, patenting life, Judaism and environmental ethics, diverse Christian environmental ethics, traditional ecological knowledge, and evolution and the place of humans. Both editors are at North Carolina State University. (v.13, #3)

VanDeVeer, Donald and Christine Pierce, eds. People, Penguins, and Plastic Trees. First ed., Belmont, CA: Wadsworth, 1986. Reviewed in Environmental Ethics 9(1987):373-75. Second edition 1995.

VanDeVeer, Donald and Christian Pierce, eds., The Environmental Ethics and Policy Book: Philosophy, Ecology, Economics. Belmont, CA: Wadsworth Publishing Co., 1994. 649 pages. Hardcover. \$ 40.50. Features interdisciplinary crossovers between philosophy and politics and economics more than some of the others. Sections: I. An Introduction to Ethical Theory. II. Western Religions and Environmental Attitudes. III. The Other Animals. IV. Constructing an Environmental Ethic, divided into A: The Broader, Biotic Community, B: Approaches to Conflict Resolution, C: Deep Ecology and Social Ecology, and D. Ecofeminism. V. Economics, Ethics, and Ecology, divided into A. Letting the Market Decide, B. Cost-Benefit Analysis, and C. Ecological Sustainability. VI. Problems and Environmental Policies, divided into A. Human Population and Pressure on Resources, B. From the Commons to Property, C. Preserving Biodiversity, D. Forests and Wilderness, and E. Degrading the Planet. VII. Varieties of Activism. A wide ranging and well conceived text. Also a useful bibliography of medium length, with directions to more extensive bibliographies. One drawback is the price. It is only in hardcover at a list price of \$ 40.50. Both authors are philosophers at North Carolina State University, and also the editors of People, Penguins, and Plastic Trees. (v4,#3)

vanDommelen (van Dommelen), A., "Precaution and the Methodological Status of Scientific (Un)certainly." Journal of Agricultural and Environmental Ethics 15(no. 1, 2002):123-139. An effective application of the Precautionary Principle (PP) hinges on the stipulation that, "a lack of scientific certainty shall not be used as a reason for postponing measures." The practical consequences of this expression are presently not clear enough in most contexts of use to enable constructive communication and therefore the PP is not sufficiently operational now. A pragmatic and fundamental methodology for understanding scientific

(un)certainty in different practical contexts needs to be put in place to create a communicative basis for effective precaution. Lack of clarity about problem definition and problem ownership creates artificial controversies that will obstruct a precautionary approach. Given the fact that different practical contexts of scientific (un)certainty exist, it may seem from one context as if no precaution is warranted whereas concerns from another relevant context may suggest otherwise. Therefore, an integrative methodological framework for communicating about scientific (un)certainty is sorely needed in international policy-making. By putting a focus on the relevance of specified research questions for the objective of taking precaution, a communicative methodology may be adopted that is dedicated to the design properties of a sustainable future. Precaution cannot be operationalized without a methodological basis that allows for effective transparency and evades the stalemates of artificial controversy. Existing debate methodologies have so far not managed to accommodate these pressing demands. KEY WORDS: communication, controversy, debate, methodology, Precautionary Principle, transparency, uncertainty. van Dommelen is with the Institute for Environmental Studies, Amsterdam, The Netherlands. (JAEE)

vanDommelen (van Dommelen), Ad van, ed. Coping with Deliberate Release: The Limits of Risk Assessment. Tilburg, The Netherlands: International Centre for Human and Public Affairs, 1996. 256 pages, index. ISBN 90-802139-4-2. Dfl 69,- (Dutch guilders). The fifteen chapters of this volume are the concerted attempt of internationally distinguished authors from Europe, the United States and Japan to map promises and perils in the emerging social and political landscape of modern biotechnology. The limits of risk assessment in relation to the deliberate release of genetically modified organisms are addressed with regard to the 'Scientific Backgrounds' (Part I), the 'Regulatory Practice' (Part II), and the 'Political Conditions' (Part III). Contributions by Philip Regal, Sheldon Krimsky, Christine von Weizsacker, Les Levidow, and others. (v7, #3)

- Vane-Wright, R. I., C. J. Humphries and P. H. Williams, "What to Protect?--Systematics and the Agony of Choice," Biological Conservation 55(1991):235-254. Note that this is a different journal from Conservation Biology; it is published in the UK. The authors propose an index of taxic diversity. This index is superior to the usual counts of species richness and abundance, because it incorporates factors of taxonomic distinctness and information encoded by cladistic relationships. Two species of rats contain less taxic diversity than a one species of rat and a panda. The index also gives attention to faunal and flora regions from which diversity originates. The index can be quantitatively expressed. Such an approach can be of vital importance in deciding what to protect and how to protect it, especially where we cannot protect everything and often have to act swiftly. The authors are with the Biodiversity Programme, Departments of Botany and Entomology, The Natural History Museum, London. (v3,#4)

Onderstepoort, South Africa. 265 pages. Rand 110.00. U.S. \$ 45.00. ISBN 1-875088-1. Ecotourism is a major and burgeoning industry in southern Africa, and tourists want to see the "Big Five": lion, leopard, elephant, buffalo, and rhino. "Game ranches," as they are called, offer tourists an opportunity to see them, with some puzzles about keeping wild animals within reasonably likely view of their customers. Twenty-six contributions to this issue. Biology of the predators and prey, interactions of predators with humans, capture and care techniques, diseases, and conservation issues. (v.9,#3)
- vanHeere, Daan, (van Heere) "Ecological Worries, Europe 1992," One World (World Council of Churches), No. 167, July 1991. Environmental concerns are still playing second fiddle to economic issues in the coming integration of Europe. The Single European Act comes into effect in full force in 1992 and brings with it ecological concerns, since the emphasis is on growth rather than sustainable development in a Europe already rather badly straining its environment. Plants are becoming extinct; polluted rivers and polluted air are the rule rather than the exception; in many places the land has been poisoned; the variety of animals is decreasing. The low priority given to environmental concerns in the process of European integration does not at all reflect European public opinion, however. One particular concern is that free traffic in a Europe without boundaries will greatly increase automotive pollution, including acid rain. (v2,#3)
- Vanin, Cristina, "The Significance of the Incarnation for Ecological Theology: A Challenging Approach," Ecotheology Vol 6 (Jul 01/Jan 02):108-122. cdvanin@uwaterloo.ca In this paper I will examine James Nelson's work in sexual ethics, particularly his attention to the significance of the incarnation for human thinking about the body (James Nelson is professor of Christian Ethics at United Theological Seminary of the Twin Cities, Minnesota, USA). Nelson argues that what the incarnation implies for an adequate understanding of human sexuality, in fact, extends beyond human beings to include the whole of the created order. I will indicate briefly that his work on the experience of embodiment is in keeping with work done on the body by other Christian writers, such as Sallie McFague. While Nelson's work is situated within the larger conversation on the meaning of the body, I argue that his methodological insights offer a unique way to develop a theology that responds to the contemporary ecological crisis. Because it attends to the immediate and personal experience of alienation from the body, it can provide strong roots for the growth of an extensive ecological worldview.
- VanKooten (Van Kooten), G. Cornelis, Land Economics and Sustainable Development: Economic Policies and the Common Good. Vancouver, BC: University of British Columbia Press. 450 pages. \$ 49.95 Canadian, cloth. Much policy is not chosen to maximize the common welfare but for a mixture of policy goals. Van Kooten strongly favors market solutions to public policy problems, where these can be

arranged. Government can only serve to facilitate such solutions; venturing further into the fray, government is likely to make things worse rather than better. The last section discusses ethics, religion, and philosophy in relation to natural resource management. (v5,#3)

VanLare (Van Lare), Paula, Growing Toward More Efficient Water Use: Linking Development, Infrastructure, and Drinking Water Policies. US. Environmental Protection Agency, Development, Community, and Environment Division (DCED), 2006. EPA 230-R-06-001. For a copy send e-mail to smartgrowth@epa.gov. Online at <www.epa.gov/smartgrowth>. Water and growth. I. The challenges of meeting demand for drinking water (requiring \$263 billion over the next 20 years). II. Accommodating growth and minimizing its effects on water consumption and distribution. III. What water policies can support the wisest growth? The U.S. West, poor in water, is often the most consumptive, using per capita twice the national average. But cities in the East are finding themselves increasingly short of water, often limiting their growth. Well-written and researched, though with the expected EPA tendency to keep growth sacrosanct (i.e. "smart").

vanTatenhove (van Tatenhove), Jan P.M., and Leroy, Pieter, "Environment and Participation in a Context of Political Modernisation," Environmental Values 12(2003): 155-174. This article discusses the relation between environment and participation in the context of different stages of political modernisation. We focus on the dynamics of environmental policy on the one hand, and the organisation of political participation on the other. The central argument is that participation is inextricably linked to environmental issues, but that their relation differs substantially over the various stages of the institutionalisation of environmental policy. While in the 1970s supplementary forms of participation dominated, the societalisation and marketisation of environmental policies from the late 1980s has given rise to new opportunities for participation, implying a more rule-altering potential. - Varandas Martins da Silva, Maria José, O Valor da Natureza: Caminhos para uma Ética Ecocentrada (Values in Nature: Toward an Ecocentric Morality). Faculdade de Letras da Universidade Clássica de Lisboa, 2000. M. A. thesis. In Portuguese. A semantic analysis of the concepts of intrinsic value, inherent value, and instrumental value in nature, within Greek philosophy, the Judeo-Christian tradition, and modern philosophy. Nature is conceived as a "dominium" and humans are entities apart from nature. The contemporary environmental crisis is a consequence of this worldview. Philosophy must rethink the relations between humans and nature and leave this closed anthropocentrism. Among environmental ethicists, Holmes Rolston, III and Baird Callicott have responded to the need for a genuine environmental ethics in which nature has intrinsic value. The "land ethic" is an ethic that can reconcile humans and nature, understanding humans as "being with" all that is. Authentic humanity has sensibility, sympathy, and compassion, qualities that are the basis of a genuine moral sense and an ethic of responsibility. (v.12,#4)
- Vardy, Peter, and Grosch, Paul, The Puzzle of Ethics. Armonk, NY: M. E. Sharpe, Inc., 1997. 238 pages. \$ 18.95. Chapter 16 is Animal Rights; Chapter 17 is Environmental Ethics. Vardy is at the University of London. Grosch is at the College of St. Mark and St. John, Plymouth, UK. (v9,#1)

Vardy, Peter, and Grosch, Paul, The Puzzle of Ethics. Armonk, NY and London, UK: M. E. Sharpe, 1997. Earlier published in the UK in 1994 by Fount Paperbacks. A summary introduction to ethics. Chapter 16, "Animal Rights," is a short but competent introduction, featuring Peter Singer, and Bernard Williams in reply. Chapter 17 is "Environmental Ethics," the is/ought controversy, three categories of environmental ethics: (1) humanist theories, (2) biocentric theories, and (3) eco-holistic theories; Bernard Williams' account. Vardy and Grosch conclude: "Any talk of environmental ethics is bound, to a greater or lesser extent, to be anthropocentric, or human-centered, for the simple reason that philosophy in general and moral reasoning in particular are straightforward human activities. ... Therefore our concern for the environment is bound to be human-centered" (p. 224). Vardy is in philosophy at Heythrop College, London University. Grosch is in philosophy at the College of St. Mark and St. John, Plymouth, UK. (v9,#2)

Varner, G. E., John Lemons, and Donald A. Brown. "Congress, Consistency, and Environmental Law." Environmental Ethics 12(1990):311-27. In passing the National Environmental Policy Act of 1969 (NEPA), Congress committed the nation to an ethical principle of living in "productive and enjoyable harmony" with the natural environment. Thus understood, NEPA can be given either (1) a technology-forcing interpretation or (2) an intelligent decision-making interpretation. We argue that in its subsequent decision to site a high-level nuclear waste repository at Yucca Mountain, Nevada, Congress acted inconsistently with this principle under either interpretation. We conclude that for the foreseeable future, the only way to handle the nation's nuclear wastes consistent with the environmental goal enunciated in NEPA is to leave them in temporary surface storage facilities, prohibit the licensing of any new nuclear power plants, and take all appropriate steps to reduce the nuclear weapons industry. Varner is in the philosophy department, Texas A & M University, College Station, TX. (EE)

Varner, Gary E. Review of Overtapped Oasis. By Marc Reisner and Sarah Bates. Environmental Ethics 14(1992):93-94.

Varner, Gary, In Nature's Interests? Interests, Animal Rights, and Environmental Ethics. New York: Oxford University Press, 1998. 154 pages. \$ 39.95. Varner characterizes "two dogmas of environmental ethics": the assumptions that animal rights philosophies and anthropocentric views are each antithetical to sound environmental policy. Beginning from the view that all and only entities with interests have moral standing, Varner defends a biocentric individualist stance with affinities to both animal rights and anthropocentric views. He argues that every living organism has interests which ought, other things being equal, to be protected, but that some interests take priority over others. In particular, he defends a sentientist principle giving priority to the lives of animals with conscious desires and an anthropocentric principle giving priority to certain very inclusive interests which only humans have. He then shows that these principles are not only consistent with, but provide significant support for, the goals on the environmentalist agenda. Along the way, Varner surveys problems facing attempts to develop a holistic environmental ethic, provides a careful analysis of the notion of desire and its scope in the animal kingdom, and improves upon available arguments for the claim that nonconscious organisms possess morally significant interests. (v.9,#3)

Varner, Gary E., "What's Wrong With Animal By-Products?", Journal of Agricultural and Environmental Ethics 7(1994):7-18. The question, "What (if anything) is wrong with animal by-products?" cannot always be adequately answered by looking at the conditions under which animals live out their productive lives. If we look beyond the conditions under which milk cows live, we can better understand some animal rights activists' reasons for objecting to dairy products. Today, beef slaughter is vastly more

humane than poultry slaughter, but if beef slaughter industry is judged immoral, the contemporary dairy industry should be judged similarly immoral, because the two are wedded. Varner is in philosophy and humanities at the Center for Biotechnology Policy and Ethics, Texas A&M University, College Station.

Varner, Gary E. "No Holism without Pluralism." Environmental Ethics 13(1991):175-79. In his recent essay on moral pluralism in environmental ethics, J. Baird Callicott exaggerates the advantages of monism, ignoring the environmentally unsound implications of Leopold's holism. In addition, he fails to see that Leopold's view requires the same kind of intellectual schizophrenia for which he criticizes the version of moral pluralism advocated by Christopher D. Stone in Earth and Other Ethics. If it is plausible to say that holistic entities like ecosystems are directly morally considerable--and that is a very big if--it must be for a very different reason than is usually given for saying that individual human beings are directly morally considerable. Varner is in the philosophy department, Texas A & M University, College Station, TX. (EE)

Varner, Gary E., Review of A Wolf in the Garden: The Land Rights Movement and the New Environmental Debate. Environmental Ethics 20(1998):441-43.

Varner, Gary E., "Biological Functions and Biological Interests," Southern Journal of Philosophy 28 (Summer 1990): 251-271. Varner defends the empirical claim that plants have needs in some sense in which simple artifacts do not, and the normative claim that those needs qualify plants for direct moral consideration. Using the concept of a biological function, we can specify, in a nonarbitrary way, what is and is not in the "biological interests" of a plant, and we can say that plants have interests without implying that simple artifacts do. Certain inadequacies of the dominant mental state theory of individual welfare suggest that such "biological interests" are morally genuine interests, which qualify their possessor for direct moral consideration. Varner critiques and attempts to improve on work by Goodpaster, Taylor, and others, showing that these authors have not paid sufficient attention to the philosophy of biology and as a consequence none has as yet identified a genuine distinction consistent with contemporary philosophy of biology that allows us to attribute interests to a non-conscious organism without implying that simple artifacts do also. Varner is Visiting Assistant Professor in the Department of Philosophy at Texas A & M University. (v1,#3)

Varner, Gary E., Interests: Their Nature, Scope, and Significance, 1988, University of Wisconsin-Madison, Ph.D. thesis. Moral agents have direct, prima facie duties toward any entity that has interests. Preference interests are probably present in all animals with a functional prefrontal cortex, and probably not present in any non-mammalian creature. Having desires does not require having true language of the kind that humans have. All and only individual living organisms have welfare interests, analyzed on the model of needs. Such a view is not impracticable but there are practicable means of adjudicating such interests. Desires ought to be given preference over biologically defined needs and the "ground projects" of humans ought to be given precedence over all interests of non-human beings. Still, humans as moral agents can, on consideration of the interests of non-human creatures, sometimes accommodate these interests. The thesis advisor was Jon H. Moline. Varner teaches philosophy at Texas A and M University.

Varner, Gary E., "The Takings Issue and the Human-Nature Dichotomy," Human Ecology Review 3 (no. 1, Autumn, 1996): 12-15. (v.9,#3)

Varner, Gary, "The Prospects for Consensus and Convergence in the Animal Rights Debate," Hastings Center Report 24 (no. 1, 1994):24-28. Those who conduct research on animals and those who advocate on behalf of animals have more in common than is generally supposed. The apparent intransigence of opposing parties is more a function of political posturing than theoretical necessity, and continuing to paint the situation as a standoff serves the interests of neither side. A critical look at the philosophical bases of the animal rights movement reveals surprising potential for convergence (agreement at the level

of policy despite disagreement at the level of moral theory) and, in some cases, consensus (agreement at both levels. Recognizing this should make defenders of animal research take animal rights views more seriously and could refocus the animal rights debate in a constructive way. Varner is in philosophy at Texas A & M University.

Varner, Gary E. "Do Species Have Standing?" Environmental Ethics 9(1987):57-72. In a recent article Christopher D. Stone has effectively withdrawn his proposal that natural objects be granted legal rights, in response to criticism from the Feinberg/McCloskey camp. Stone now favors a weaker proposal that natural objects be granted what he calls legal considerateness. I argue that Stone's retreat is both unnecessary and undesirable. I develop the notion of a de facto legal right and argue that species already have legal rights as statutory beneficiaries of the Endangered Species Act of 1973. I conclude that granting certain nonhuman natural entities legal rights is both more important and less costly than Stone and his critics have realized, and that it is not Stone's original proposal which needs rethinking, but the concept of interests at work in the Feinberg/McCloskey position. Varner is in the philosophy department, University of Wisconsin, Madison, WI. (EE)

Varner, Gary E. "The Schopenhauerian Challenge in Environmental Ethics." Environmental Ethics 7(1985):209-29. Environmental holism and environmental individualism are based on incompatible notions of moral considerability, and yield incompatible results. For Schopenhauer, every intelligible character--every irreducible instance of formative nature--defines a distinct moral patient, and for him both holistic entities and the individual members of higher species have distinguishable intelligible characters. Schopenhauer's neglected metaethics thus can be used to generate an environmental ethics which is complete in the sense of synthesizing holism and individualism while simultaneously meeting Tom Regan's (implicit) demand that an environmental ethics make moral patients of natural objects. Varner is in the philosophy department, University of Wisconsin, Madison, WI. (EE)

Varner, Gary E. Review of Earth and Other Ethics. By Christopher Stone. Environmental Ethics 10(1988):259-65.

Varner, Gary E., "Environmental Law and the Eclipse of Land as Private Property," in Frederick Ferré and Peter Hartel, eds., Ethics and Environmental Policy (Athens, GA: University of Georgia Press, 1994), pages 142-160. As environmental laws and regulations proliferate, we increasingly treat land as a public resource owned in common and held by individuals only a stewardship or trust capacity. With particular discussion of Lucas v. South Carolina Coastal Commission. Also discussion of the takings controversy. The notion that ecological processes ought to be regarded as public goods like air, oceans, and wildlife, which all individuals have a right to use, allows us to construe environmental regulation as an exercise of police power, as designed to prevent harm. But what is really left of the concept of land as private property after we have done this? Varner is in philosophy and humanities at the Center for Biotechnology Policy and Ethics, Texas A&M University, College Station.

Varner, Gary E., "In Defense of the Vegan Ideal: Rhetoric and Bias in the Nutritional Literature", Journal of Agricultural and Environmental Ethics 7(1994):29-40. Much of the scientific literature on vegetarian nutrition leaves one with the impression that vegan diets are significantly more risky than omnivorous ones, especially for individuals with high metabolic demands (such as pregnant or lactating women and children). But nutritional researchers have tended to skew their study populations toward "new vegetarians", members of religious sects with especially restrictive diets and tendencies to eschew fortified foods and medical care, and these are arguable the last people we would expect to thrive on vegan diets. And, in spite of these methodological and rhetorical biases, for every nutrient which vegans are warned to be cognizant of, there is reason to believe that they are not significantly greater risk of nutritional deficiency than omnivores. Varner is in philosophy and humanities and biotechnology policy/ethics at Texas A&M University, College Station.

Varner, Gary E., "Rejoinder to Kathryn Paxton George", Journal of Agricultural and Environmental Ethics 7(1994):83-86.

Varner, Gary E. Nature's Interests? Interests, Animal Rights, and Environmental Ethics. Reviewed in Environmental Ethics 21(1999):433-436.

Varner, Gary E., "The Takings Issue and the Human-Nature Dichotomy," Human Ecology Review 3(no. 1, 1996):12-15. The wise-use movement's position on takings compensation depends on an implausible separation of humans from the ecosystems on which we depend. They call for compensation when environmental regulation is forced upon them, even when such regulation is protecting ecosystemic goods and preventing their harm to others. Environmentalists (advocating regulation) are insisting on harmonious human relationships with nature. Varner is in philosophy, Texas A&M. (v.13,#1)

Varner, Gary E. Review of The Animal Rights/Environmental Ethics Debate: The Environmental Perspective. Edited by Eugene C. Hargrove. Environmental Ethics 15(1993):279-82.

Varner, Gary. "The Takings Issue and the Human-Nature Dichotomy," Human Ecology Review 3, 1 (Autumn 1996): 12-15. Environmentalists are sometimes criticized for implausibly separating human beings from nature. However, in the debate between the "wise-use" and environmental movements, it is the proponents of "wise-use," not the environmentalists, who implausibly divide human beings from nature. The "wise-use" movement calls for landowners to be compensated whenever environmental regulations reduce the economic value of their land. However, a well-established principle of Constitutional law is that compensation is not required if the regulations prevent harm to others. Insofar as they can plausibly be construed as preventing harm to others, then, environmental regulations can be enforced without running afoul of the just compensation clause of the Fifth Amendment. Varner argues that while the public trust doctrine of U.S. common law can be extended to cover ecological processes on which the long-term well-being of the nation and its people depend, environmentalists must do a better job of articulating how this is so. In doing so, environmentalists will show that the wise use movement's position depends on an implausible separation of humans from the ecosystems on which they depend. Varner teaches philosophy at Texas A&M University. (v8,#1)

Varzi, Achille C., "Vagueness in geography," Philosophy and Geography 4 (No. 1, 2001): 49-65. Some have

argued that the vagueness exhibited by geographic names and descriptions such as 'Albuquerque', 'the Outback', or 'Mount Everest' is ultimately ontological: these terms are vague because they refer to vague objects, objects with fuzzy boundaries. I take the opposite stand and hold the view that geographic vagueness is exclusively semantic, or conceptual at large. There is no such thing as a vague mountain. Rather, there are many things where we conceive a mountain to be, each with its precise boundary, and when we say 'Everest' we are just being vague as to which thing we are referring to. This paper defends this view against some plausible objections. Varzi is Associate Professor of philosophy at Columbia University. (P&G)

Vaske, Jerry J., and Donnelly, Maureen P., "A Value-Attitude-Behavior Model Predicting Wildland Preservation Voting Intentions," Society and Natural Resources 12(1999):523-537. A survey of Colorado residents. The biocentric/anthropocentric value orientation continuum predicts a respondent's attitude toward the preservation of wildlands. The attitude fully mediated the relationship between value

orientation and behavioral intention to vote for wildland preservation. The authors are in Natural Resource Recreation and Tourism, Colorado State University.

Vatn, Arild, Review of Mick Common and Sigrid Stagl, Ecological Economics: An Introduction, Environmental Values 15(2006):527-529.

Vatn, Arild. "The Environment as a Commodity." Environmental Values 9(2000):493-509. Abstract: This paper addresses problems related to transferring market concepts to non-market domains. More specifically it is about fallacies following from the use of the commodity concept in environmental valuation studies. First of all, the standard practice tends to misconstrue the ethical aspects related to environmental choices by forcing them into becoming ordinary trade-off problems. Second, the commodity perspective ignores important technical interdependencies within the environment and the relational character of environmental goods. These are all properties that have made many such goods escape the commoditisation pressure of markets in the first place. Further, it is shown that these interdependencies are the source of some of the ethical dilemmas observed. Finally, inherent characteristics of the environment tend to make the concept of the margin, so indispensable to economic calculus, either difficult or irrelevant to define. The commodity 'fiction' twists the perception of the environment from systems preservation to items use or transformation. This is a problem of increased importance as we approach potential systems perturbations. Keywords: Economic theory, environmental ethics, systems theory, valuation. Arild Vatn is in the Department of Economics and Social Sciences, Agricultural University of Norway, Postbox 5033, 1432 Aas, Norway. (EV)

Vaughan, Ray, Essentials of Environmental Law. Rockville, Md: Government Institutes, 1994. 182 pages. Paper. \$ 42. Good book but considerably overpriced. Federal statutes that limit government and industry action. Natural resource laws. Wildlife laws. State laws and regulations. Toxic torts. How to identify and resolve environmental problems. "In essence, the most fundamental measure of any environmental legal system will be how we human beings view our fellow earthlings and what we are willing to do for them and their survival even when there is no readily apparent corresponding benefit for ourselves. Even in the one law most designed to address the decline of other species, the Endangered Species Act, we have not truly attempted to address what value a species is in and of itself and what value another species may put on us. The fundamental ethics of an honest and open relationship with the Earth, other species, and even our fellow human beings have not been attempted in environmental laws, and so, those laws fail to truly protect the environment and other beings. Consequently, those laws also fail to protect human beings at anything more than a rudimentary level of insuring survival of our species and of insuring the economic vitality of society" (Preface). Vaughan is an environmental lawyer in Alabama. This publisher also publishes state environmental law handbooks to almost all of the states. (v5,#4)

Väyrynen, Kari, "Virtue Ethics and the Material Values of Nature," Philosophy in the Contemporary World 8 (Number 2, Fall-Winter 2001):137-148. For Aristotle, man is part of nature, a "political animal" with the faculty of reason. In this sense, Aristotelian virtue ethics can be said to relate virtues to nature. On the one

hand, virtues lean on the natural dispositions of man as a social animal. On the other hand, virtues are connected to praxis, that is, with man's active realization of his inherent biological, social and cultural potential. Recently, the material value ethics of Max Scheler and Nicolai Hartmann developed the Aristotelian tradition in a naturalistic direction, posing the problem of the value of life and connecting this question to the question of virtue. Virtues sensitize us to values and are, therefore, especially important for ethical praxis. I claim that precisely because of its historical and cultural concreteness, virtue ethics can be successfully applied to environmental issues. In critical connection with common mentalities, naturalistic virtue ethics can be a politically effective way of ethical thinking. Vayrynen is in the Department of History, Academy of Finland, Oulu, Finland. (v.13,#2)

Velayos, Carmen. *Ética y cambio climático [Ethics and Climate Change]*. Paris: Desclée De Brouwer, 2007. No es demasiado tarde, pero la humanidad necesita empezar a actuar colectivamente para poner freno a la crisis climática que padecemos y que, sin duda, es uno de los más graves retos sociales que jamás hayamos padecido. Organismos internacionales reconocen que el cambio climático es un problema eminentemente *ético*. En primer lugar, su origen es humano: el aumento global de emisiones de gases de efecto invernadero. Se ha de comenzar a entender la crisis climática como un daño producido y no como un *mal* inevitable. En segundo lugar, ni su generación ni su desenlace han sido ni serán equitativos. No todos hemos contaminado en la misma medida ni resultamos igualmente vulnerables a sus efectos. Los países que menos han contribuido al cambio climático seguramente se verán más afectados. Todo esto genera importantes cuestiones éticas que inciden en el reparto de la responsabilidad, en la salvaguarda de derechos humanos básicos, en la precaución colectiva frente a los riesgos, en la pregunta por nuevos hábitos o por la búsqueda de la felicidad.

Verbeek, Bernhard: "Kultur: Die Fortsetzung der Evolution mit anderen Mitteln (in German: Culture: The Continuation of Evolution with different means), Natur und Kultur 1 (No. 1, 2000):3-16. Genetic programmes generate human brains; these induce psyches which interact and produce a new type of evolutionary phenomenon: culture. It is true that the existence of culture depends on genetic programmes, which are hostile to alteration, but changes in culture neither depend strictly on new generations nor on changes in genes. A result of this is the breathtaking alteration of planet earth. The tree of those parts of culture which are the same all over the world still blossoms, but it will saw itself off its roots, if the accelerated culture continues processing in blind haste as the organismic evolution. (v.11,#2)

Verburg, Rudi M. and Vincent Wiegel. "On the Compatibility of Sustainability and Economic Growth." Environmental Ethics 19(1997):247-265. It is generally assumed that sustainable development and economic growth are compatible objectives. Because this assumption has been left unspecified, the debate on sustainability and growth has remained vague and confusing. Attempts at specification not only involve clarification of the interrelation of the two concepts, but also, we argue, require a philosophical approach in which the concepts of sustainability and economic growth are analyzed in the context of our frame of reference. We suggest that if the notion of sustainability is to be taken seriously, the conflicting conceptual and normative orientations between the two concepts require the reconsideration of our frame of reference. Verburg and Wiegel are both in economics and philosophy at Erasmus University, Rotterdam, The Netherlands. (EE)

Verhoog, H. "The Concept of Intrinsic Value and Transgenic Animals", Journal of Agricultural and Environmental Ethics 5(1992):147-160. Much has already been written on the concept of "intrinsic value", but until now not in connection with biotechnology in general and the creation of so-called "transgenic organisms" in particular. I will concentrate on transgenic animals in this paper. The creation of transgenic animals by means of modern techniques of genetic manipulation is evaluated in the light of different interpretations of the concept of intrinsic value: zoocentric interpretation, biocentric or ecocentric approach. Verhoog is in the Institute of Theoretical Biology, Leiden University, The Netherlands.

Verhoog, Henk, Matze, Mirjam, Van Bueren, Edith Lammerts, and Baars, Ton,

"The role of the concept of the natural (naturalness) in organic farming," Journal of Agricultural and Environmental Ethics 16(2003):29-49. Producers, traders, and consumers of organic food regularly use the concept of the natural (naturalness) to characterize organic agriculture and or organic food, in contrast to the unnaturalness of conventional agriculture. Critics sometimes argue that such use lacks any rational (scientific) basis and only refers to sentiment. In our project, we made an attempt to clarify the content and the use of the concepts of nature and naturalness in organic agriculture, to relate this conception to discussions within bioethical literature, and to draw the implications for agricultural practice and policy. We conclude that the idea of "naturalness" can be used to characterize organic agriculture and to distinguish it from conventional agriculture, but only if naturalness not only refers to not using chemicals but also to ecological principles and respect for the integrity of life. Thus perceived, the principle of naturalness can also serve as a guide to future developments in the field of organic agriculture. As part of the holocentric ethics of organic farming the value of naturalness has three dimensions: a cognitive one, an emotive one, and a normative one. KEY WORDS: concept of nature and naturalness, environment, ethics, farm ecology, integrity of life, organic agriculture and food. (JAEE)

Verissimo, Adalberto, Cochrane, Mark A., and Sousa, Jr., Carlos, "National Forests in the Amazon," Science 297(20 August 2002):1478. Brazil has vast natural resources and a great need for economic development.

The Brazilian government is planning to balance Amazonian development with a new forest policy involving managed timber production and a greatly expanded system of National Forests (Flonas). By 2010, 40 million hectares of new Flonas will be created, an areas as large as Spain. The scale of this initiative is equivalent to the 1908 establishment of the U.S. National Forest system and is unprecedented in the tropics. The authors are with the Instituto do Homen e Meio Ambiente da Amazônia, Belém, Brazil. (v.13,#4)

Vermeij, G.J. "An Agenda for Invasion Biology", Biological Conservation 78(no.1/2, 1996):3.

Vermeij, Geerat J., Nature: An Economic History. Princeton, NJ: Princeton University Press, 2004, 2006. The universal truth on Earth is that organisms compete for scarce resources, and this universal truth unites three disciplines: economics, evolution, and cultural history, disciplines that otherwise have developed in mutual isolation. All three competitive processes develop cooperation, adaptation, and feedback. Historical patterns in both human and nonhuman evolution follow from this principle. Vermeij is in geology, University of California, Davis.

Vermeir, Iris, and Wim Verbeke, "Sustainable Food Consumption: Exploring the Consumer 'Attitude - Behavioral Intention' Gap," Journal of Agricultural and Environmental Ethics 19(2006):169-194. Although public interest in sustainability increases and consumer attitudes are mainly positive, behavioral patterns are not univocally consistent with attitudes. This study investigates the presumed gap between favorable attitude towards sustainable behavior and behavioral intention to purchase sustainable food products. The impact of involvement, perceived availability, certainty, perceived consumer effectiveness (PCE), values, and social norms on consumers' attitudes and intentions towards sustainable food products is analyzed. The empirical research builds on a survey with a sample of 456 young consumers, using a questionnaire and an experimental design with manipulation of key constructs through showing advertisements for sustainable dairy. Involvement with sustainability, certainty, and PCE have a significant positive impact on attitude towards buying sustainable dairy products, which in turn correlates strongly with intention to buy. Low perceived availability of sustainable products explains why intentions to buy remain low, although attitudes might be positive. On the reverse side, experiencing social pressure from peers (social norm) explains intentions to buy, despite rather negative personal attitudes. This study shows that more sustainable and ethical food consumption can be stimulated through raising involvement, PCE, certainty, social norms, and perceived availability.

Keywords: attitude - behavior - consumer - food - sustainable consumption. Vermeir is in Department of Business Administration, Hogeschool Gent, Gent, Belgium. Verbeke is in the Department of Agricultural Economics, Ghent University, Gent, Belgium.

Versfeld, Martin (Marthinus) (1909-1995), "The Egology of Ecology," pp. 221-230 in Versfeld, Sum: Selected Works. Cape Town: The Carrefour Press, 1991. What it means to be an "ego" in an "eco-system." The ego is an unreal self, a self-enclosed inner world; but the self is in reality always in an environment, which contains other humans and their artifacts, but also a natural world. "Real conservation is the freeing of Being, and it has its source and end in the freeing of inner being." "It will not profit us to gain the whole world if we do not creatively conserve ourselves." "When you chop down a tree, make sure that you are not chopping down the tree of life, the Paradise Tree." "Realize that you are not in the body, but the body in you, and the outer world, which is continuous with your body, shares in your salvation." Versfeld taught philosophy for many years at the University of Cape Town.

Versfeld, Martin (Marthinus) (1909-1995), "On the Rights of Man and the Rights of Rocks," pp. 199-209 in Versfeld, Sum: Selected Works. Cape Town: The Carrefour Press, 1991. (The title: Sum is from Descartes' Cogito, ergo sum). Earlier, privately printed. "We were to hear a lot about the rights of man the developer and nothing about the rights of rocks. But this attitude to nature does not seem to me to make sense. It is highly artificial. In our ordinary experience, rocks have character and individuality and answer back. I know a sandstone wall where every rock speaks out its name. Stones sparkle with a manifold difference ... I submit that one can't write off the whole tradition of sacred stones and places ... as though it were simply due to a pre-scientific ignorance. ... Rocks, then, have enjoyed a good deal of reverence. If you see them at Stonehenge or Carnac the word 'enjoy' does not seem entirely misplaced. Perhaps it is not so much a case of anthropomorphism as of symbiosis, a kind of life in rocks which our ancestors sensed when they maintained that some megaliths walked." Versfeld taught philosophy for many years at the University of Cape Town. (v6,#3)

Vesilind, P. Aarne, "Vestal virgins and engineering ethics," Ethics and the Environment 7(2002):92-101. Professional engineers are bound, by their code of ethics to place paramount the health, safety, and welfare of the public. If the "public" includes future people, then the engineer is also morally responsible for not destroying the supporting environment that will make future generations possible. In this essay I suggest that the present engineering codes of ethics are inadequate in addressing the problem of maintaining environmental quality. Engineers can, while staying well within the bounds of the present codes of ethics, destroy or modify the environments that support the global ecosystem and in such manner kill future humans on a grand scale. The moral responsibilities of engineers must therefore include the commitment to provide a high quality and sustainable environment for future generations and this requires that the engineering codes of ethics be modified to encourage engineers to make decisions that promote environmental stability and sustainability. (E&E)

Vest, Jay Hansford C. "The Philosophical Significance of Wilderness Solitude." Environmental Ethics 9(1987):303-30. With the enactment of the Wilderness Act, wilderness solitude has become a major issue in the assessment and designation of wilderness areas. Interpreting this solitude criterion to mean loneliness, federal agencies have judged wildlands according to their "isolation potential." This perspective is highly inaccurate given the etymological derivation of solitude--"soul-mood." Wilderness solitude is in fact a communion with wild nature. Philosophically it reflects a wilderness episteme and land aesthetic grounded in organicism. The natural aesthetic categories of Sole--the rare or unique --and the Sublime properly reflect the intent of wilderness solitude in cognitive experience. The result of this experience is an "at-one-ment" with wild nature affirming religious rapture and ecological egalitarianism. Consequently, federal agencies ought to employ wilderness review criteria grounded in natural aesthetic theory. Vest is a visiting scholar in the department of religious studies, University of Montana, Lolo, MT. (EE)

Viagem Filosofica--Uma Redescoberta da Amazônia. Philosophical Journey--A Rediscovery of the Amazon, 1792-1992. Rio de Janeiro: Associação Promotora de Instrução, Editoria Index, 1992. ISBN 85-7083-036-X. Six essays commemorating the extensive, nine-year naturalist expedition of Alexandre

Rodrigues Ferreira (1756-1815), 200 years ago, who was already concerned about conservation, and using this to document changes since in the Amazon, all in reflection over its future. With particular reference to biodiversity and the human responsibility to conserve it. Parallel text in Portuguese and English. Nicely illustrated. (v4,#3)

Vickery, Jim Dale, "A Necessary Violence," Backpacker, October 1993. The author lives in a lakeside cabin near the Boundary Waters Canoe Area in Minnesota. There are deer near his cabin, whom he has given names, and one afternoon he watches a wolf attack a deer but fail to kill it. Thinking about the deer's suffering, sixteen hours later he decides to mercy-kill it. "'It's okay,' I said softly to the yearling, then cocked my gun and aimed it at her forehead. Her eyes were clear and soft, resigned yet aware of our mutual recognition of imminent death. She never took her eyes off mine as I apologized in my heart. A connection was made, some heightened pack deep and everlasting, one we alone would know, as I followed through with what I had to do." He follows those who eat the carcass. "The yearling was becoming raven and wolf, flowing back into the land." (v4,#4)

Phenomenological approaches, analytical approaches, transcendental approaches, represented by Kant and Emerson, and postmodern trends. (v5,#2) (Finland)

Vilkka, Leena, The Varieties of Intrinsic Value in Nature: A Naturalistic Approach to Environmental Philosophy (in English). Ph.D. thesis at the University of Helsinki, November 1995. The thesis examines the varieties of intrinsic value in nature proposed by various philosophers and then progressively defends an animal-centered philosophy (zoocentrism), a life centered-philosophy (biocentrism) and an ecosystem-centered philosophy (ecocentrism), culminating in a defense of objective intrinsic value in nature and of the rights of animals. The thesis has been published in Finland, in a limited edition, and was published in 1997 by Editions Rodopi (Amsterdam/Atlanta) in their Value Inquiry Book Series, Robert Ginsburg, editor. This is the first Ph.D. thesis in Finland in environmental philosophy. (v7,#1)

Vilkka, Leena, et al, Matsän tulevaisuuskuvia (The Future of Forests). Helsinki: Painatuskeskus and Opetusministeriö (Ministry of Environment), 1993. 68 pages. Puts together three different groups: the academic level, government professionals, and politicians, asking what Finnish forests might be in fifty years. Forests as related to Finnish social development. Short articles. Statistics. A section on the aesthetic value of forests, on the Finnish national identity and their forests, forests and economics, and the multiple values in forests. (v5,#2) (Finland)

Vilkka, Leena, "Respect for Animals: A Zoocentric Theory of Animals' Rights." Paper presented at the World Vegetarian Congress, August 8-13, 1994, in Holland. There are three basic attitudes to nature: technocentrism, anthropocentrism, and naturocentrism. There are three nature-centered positions: zoocentrism, stressing sentience, biocentrism, stressing respect for all life, and physiocentrism, stressing the well-being of the planet Earth. Zoocentrism requires respect for animals, and takes animal suffering into moral account, though one ought also morally to consider the well-being of nonsentient nature. Copy available from the author, address above. (v5,#2) (Finland)

Vilkka, Leena, "Should We Preserve Intrinsic Values in Wilderness?" Pages 160-175 in Anna-Liisa Sippola, Pirjo Alaraudanjoki, Bruce Forbes and Ville Hallikainen, eds., Northern Wilderness Areas: Ecology, Sustainability, Values (Rovaniemi, Finland: University of Lapland, Arctic Centre, 1995). In a volume resulting from the International Conference on Northern Wilderness Areas held there in December 1994. According to anthropocentrism, humans can value wilderness for its own sake, but nature is valueless without human valuers. From the naturocentric point of view, the value of a wilderness area is discovered in the natural history of the area. Naturocentrism is the objective intrinsic value of wilderness, according to which wild animals and plants should at least sometimes win, their intrinsic values having priority over human instrumental values. Vilka is with the Environmental Philosophy Project, P. O. Box 12, Fin-00014, University of Helsinki, Finland. (v7,#4)

Vincent, Andrew, "Liberalism and the Environment," Environmental Values 7(1998): 443-459. The article scrutinises the complex relation between late twentieth century liberal and environmental thought. It concludes that if the key values of contemporary liberal and environmental thought are compared then the prognosis looks gloomy. There are implicit and deep tensions over most value questions. In order to provide a coherent focus for this analysis, the paper addresses the issue of liberal justice, namely, can liberal theories of justice be sensitively applied to environmental questions? The answer to this question is that for much environmental thought, it is the very values and practices implicit within liberal justice theory which now constitute the key environmental danger. KEYWORDS: liberalism, environmentalism, distributive justice, procedural justice, individualism, value theory. Andrew Vincent is at the University

of Wales Cardiff. (EV)

- Virtanen, Pekka, "The Role of Customary Institutions in the Conservation of Biodiversity: Sacred Forests in Mozambique," Environmental Values 11(2002): 227-241. Recently the role of customary local institutions in the conservation of biological diversity has become a topic of widespread interest. In this paper the conservation value of one such institution, traditionally protected forest, is studied with regard to its ecological representativity and institutional persistence. On the basis of a case study from Mozambique the paper concludes that traditionally protected forests do have a practical conservation value, especially as fire refuges and in the preservation of metapopulations of endangered species. However, it is also important to recall their spiritual aspect, which is crucial for their continuing appreciation and upholding. Even though customary institutions are still strong in the study area, they are subject to power struggles at both local and national levels. In the present context of political transition, any outside interventions regarding such local institutions as sacred forests, which have high symbolic value, should be considered carefully. (EV)
- Vischer, Lukas, ed., Rights of Future Generations, Rights of Nature: Proposal for Enlarging the Universal Declaration of Human Rights. Study No. 19 from the World Alliance of Reformed Churches. May 1990.

A group of European theologians has proposed that the World Alliance of Reformed Churches enlarge a 1976 declaration of human rights with a similar declaration extended to future generations and to nature.

The proposal reads in part:

"We support the attribution of rights not only to humans but also to nature, God's creation, and we reject the view that animate and inanimate nature are mere objects which stand at the arbitrary disposal of the human. ...

1. Nature--animate or inanimate--has a right to existence, that is, to preservation and development.
2. Nature has a right to the protection of its ecosystems, species, and populations in their interconnectedness.
3. Animate nature has a right to the preservation and development of its genetic inheritance.
4. Organisms have a right to a life fit for their species, including procreation within their appropriate ecosystems.
5. Disturbances of nature require a justification. They are only permissible
 - when the presuppositions of the disturbance are determined in a democratically legitimate process and with respect of the rights of nature,
 - when the interests of the disturbance outweigh the interests of a complete protection of the rights of nature, and
 - when the disturbance is not inordinate.

Damaged nature is to be restored whenever and wherever possible.

6. Rare ecosystems, and above all those with an abundance of species, are to be placed under absolute protection. The driving of species to extinction is forbidden."

The proposal is argued in five accompanying papers, including one by Jurgen Moltmann. In German and also in English. Available from the World Alliance of Reformed Churches, 150, route de Ferney, CH-1211 Geneva 20, Switzerland. Phone 22 916237. (v1,#2)

Visions of America: Landscape as Metaphor in the Late Twentieth Century. Denver, CO: The Denver Art Museum and Columbus, OH: The Columbus Museum of Art, publishers. Distributed by Harry N. Abrams, Inc., 1994. ISBN 0-8109-3925-8. With essays by Martin Friedman, John Beardsley, Lucinda Furlong, Neil Harris, Rebecca Solnit, John R. Stilgoe. Though the idyllic landscapes of nineteenth-century painting linger in the modern consciousness, for today's artists, the definition of landscape has undergone radical modification, to the point where it includes all visible--and myriad invisible--aspects of nature. While the scenic wonders of the continent have not lost their power to stir the imagination, the troubled state of America's natural resources has caused concern nationwide. The accelerated disappearance of wilderness lands and other crisis-level environmental concerns have made it impossible to continue to regard the American landscape as inviolable and unchanging. Against this background of uneasy awareness, the American landscape assumes a particular urgency for many contemporary artists. Thirteen artists were commissioned for the exhibition that this book records, and they display landscape as an all-encompassing theme affected by many aspects of contemporary American culture, and not just a vehicle for aesthetic exploration. Landscape is, more profoundly, a metaphoric means of eloquently expressing their social, psychological, and technological concerns. The sculptures of Mel Chin, for instance, often evoke nature under siege and a nagging concern for the planet's endangered ecology.

Vitousek, Peter M., "Beyond Global Warming: Ecology and Global Change," Ecology 75(1994):1861-1876. Three well-documented global changes are: increasing carbon dioxide in the atmosphere; alterations in the global nitrogen cycle; and ongoing land use/cover change. The carbon dioxide increase since 1800 is unique in the past 160,000 years, and likely to have climatic consequences and direct effects on biota in all Earth's ecosystems. More nitrogen is fixed annually by humans (primarily for

fertilizer, also by legume crops and as a byproduct of fossil fuel consumption) than by all natural pathways combined. This alters aquatic ecosystems, contributes to eutrophication of the biosphere, and affects biological diversity. Land use has transformed one-third to one-half of Earth's ice free surface, with major effects even on otherwise pristine areas downwind and downstream. There is little uncertainty that serious changes are impending. Ecologists should speak out to help effective discussion about what can and should be done. Vitousek is in biology at Stanford University. (v5,#4)

(v.11,#1)

Vogel, Gretchen, "Conflict in Congo Threatens Bonobos and Rare Gorillas," Science 287(31 March, 2000):2386-2387. Conflict in the Congo Threatens Bonobos and Rare Gorillas. The war that has gripped the Democratic Republic of Congo for the past eighteen months, killing thousands and displacing more, is also taking a devastating toll on great apes. The front lines of the war, which involve troops from a half-dozen central Africa nations, cut through the heart of the range of bonobos, the pygmy chimpanzees. Further east, more than half of the 240 eastern lowland gorillas known in one study area have been killed by poachers. The animals are mostly killed for meat to eat by poachers and hungry troops. (v.11,#1)

Vogel, Gretchen, "Cloned Gaur a Short-Lived Success," Science 291(19 January 2001):409. Cloned Gaur a short-lived success. A baby gaur, a wild ox native to and endangered in Southeast Asia, cloned and given birth by an ordinary cow at a genetics center in Iowa, died a day after birth. But the death may be unrelated to the cloning process. (EE v.12,#1)

Vogel, Gretchen, "FDA Report Scores Chimp Research Lab," Science 286(12 November 1999):1269-1271. The Coulston Foundation, a private chimp breeding and research facility in Alamogordo, New Mexico, has been severely criticized by a U.S. Food and Drug Administration report for violating many procedures, resulting in sloppy science, and in some cases leading to chimpanzee deaths. (v10,#4)

Vogel, Joseph Henry, Genes for Sale: Privatization as a Conservation Policy. New York: Oxford University Press, 1994. 155 pages. \$29.95, hardcover. "The thesis of this book is that the creation of property rights over genetic information can make habitat preservation compete with alternative land uses" (33). This is "the baseline ethic assumed in the policy: those who benefit pay the costs associated with the benefits" (5). Vogel proposes "a gargantuan database" that can track what plants grow on whose land, with "genestealers" who protect such land from development, and share the royalties when useful finds are made. The proposal raises all the issues of ownership of genetic diversity, plus issues of whether landownership tied to genetic diversity rights is likely to produce a just distribution of costs and benefits. He deplores the idea of a common good of mankind.

One of Vogel's provocative illustrations. Chimpanzees know what species of plants to eat when they are sick. Jane Goodall discovered this "monkey know how" (43). Some 27 species are under investigation. What if a pharmaceutical company, alerted by this chimp behavior, uses one of these plants to make a new drug? Jane Goodall should establish a property right to these plants; pharmaceutical companies should pay her when they use such plants. "The economic advice to Goodall is that she keep her findings secret until privatization eventuates" (43). But, since Jane Goodall doesn't own the land on which the chimpanzees live, nor does she own the chimpanzees, perhaps neither Goodall nor the pharmaceutical companies have a right to steal the chimp's knowledge without compensating them. This could be the solution to chimp conservation! Vogel teaches economics at the Facultad Latinoamericana de Ciencias Sociales, Quito, Ecuador. The history of the concept of nature in Critical Theory, with chapters on Lukács, Horkheimer and Adorno, Marcuse, and Habermas. The tradition has been marked by serious difficulties with respect to the concept of nature. These problems are relevant to contemporary environmental philosophy as well. A solution to them requires taking seriously--and literally--the idea of nature as socially constructed. Vogel teaches philosophy at Denison University. (v6,#4)

Vogel, Steven . "Environmental Philosophy after the End of Nature." I call for "postnaturalism" in environmental philosophy—for an environmental philosophy that no longer employs the concept nature. First, the term is too ambiguous and philosophically dangerous and, second, McKibben and others who argue that nature has already ended are probably right—except that perhaps nature has always already ended. Poststructuralism, environmental history, and recent science studies all point in the same direction: the world we inhabit is always already one transformed by human practices. Environmental questions are social and political ones, to be answered by us and not by nature. Many will worry that this conclusion leads to environmentally pernicious consequences, and to problems of relativism and idealism, but I argue that it does not. Practices are real, not ideal, and not all practices are equal: those that acknowledge human responsibility for transforming the world are preferable to those that don't. Environmental harm results when we do not recognize our own responsibility for the world our practices create. Environmental Ethics 24(2002):2339. (EE)

Vogel, Steven, "Nature as Origin and Difference: On Environmental Philosophy and Continental Thought," Philosophy Today 42 (SPEP Supplement, 1998):169-181. Four accounts of nature in contemporary continental thought, and the difficulties each face, and what each might provide in terms of a philosophically adequate environmental theory.

(1) Nature as origin. "Nature on this account functions as an immense and complex and organic whole, a massive order in which humans are embedded and out of which they emerged" (p. 169). "Nature on this first account is where we came from; it is the origin or foundation on which everything else is built, and we ignore this at our peril" (p. 170).

(2) Nature critiqued. Nature is a social construction. "The unmistakable implication of this line of argument is that nature doesn't exist" (p. 170). "The way we see and think of it never reveals to us a nature-an-sich, but always a nature from our particular social and historical perspective" (p. 171).

(3) Nature as difference. Nature "appears now as the name we might give to the otherness of the world, to that which is always left out of any attempt to grasp the world as a whole and bring it entirely into the light. This is the radical form a postmodern anti-foundationalism takes" (p. 172).

(4) Nature as practice (the alternative preferred by Vogel). "We know the real world because we are involved in constituting it, ... taking the idea of 'construction' literally. It is through our practices, which are in the first instance above all laboring practices, that the world around us is shaped into the world it is." "A philosophy of practice, then, directs our attention to the built environment, which for most of us is the environment--and it is with this environment, I would argue, that 'environmental theory' ought to begin" (p. 175). "The whole environment in a certain sense is a built environment. ... There is no deep ontological difference between cities and parks" (p. 176). "There is no way nature really is, and so naturalistic attempts to find the solution to environmental problems by reading them off from nature are doomed to fail" (p. 177). Vogel is in philosophy, Denison University, Granville, OH.

Vogel, Steven, "The Silence of Nature," Environmental Values 15(2006): 145-171.

In claiming that 'nature speaks', authors such as Scott Friskics and David Abram implicitly agree that language use is linked to moral considerability, adding only that we need to extend our conception of language to see that non-humans too use it. I argue that the ethical significance of language use derives from its role in dialogue, in which speakers make truth-claims, question and potentially criticise the claims of others, and provide justifications for the claims they raise themselves. Non-human entities (as a contingent matter) seem not to engage in dialogue in this sense, and none of the examples Friskics and Abram offer suggest that they do. Thus the conception of language such authors employ is too weak to support the ethical conclusions they implicitly wish to defend. (EV)

Vogel, Steven. "The Nature of Artifacts." Environmental Ethics 25(2003):149-168. Philosophers such as Eric Katz and Robert Elliot have argued against ecological restoration on the grounds that restored landscapes are no longer natural. Katz calls them "artifacts," but the sharp distinction between nature and artifact doesn't hold up. Why should the products of one particular natural species be seen as somehow escaping nature? Katz's account identifies an artifact too tightly with the intentions of its creator: artifacts

always have more to them than what their creators intended, and furthermore the intention behind some artifacts might explicitly be to allow things to happen unpredictably. Indeed, to build any artifact is to employ forces that go beyond the builder: in this sense all artifacts are natural. Recognizing the naturalness of artifacts can help encourage the key environmental virtues of self-knowledge and humility. (EE)

Voges, F.W.J. (Ian), Sustainable Development and the Socially Embedded Firm. An Inquiry into the Nature, Causes and Transformation of Structural Unsustainability in Contemporary Liberal Capitalism. D.Phil. Dissertation at the University of Stellenbosch, South Africa, 1999. Voges argues that unsustainability is not an incidental consequence, but rather a structural feature of contemporary liberal capitalism. Sustainable development can be adequately conceptualised as intra- and intergenerational justice within the framework of Rawlsian constitutional liberalism. However, the Anglo-American model of capitalism that drives economic globalization does not represent the optimal institutional configuration for implementing intra- and intergenerational justice in the economy and corporations. The theory of associative democracy and contemporary political economics indicate that liberal capitalism can accommodate intra- and intergenerational justice if institutionally supplemented with empowered associations that play a visible role in economic and corporate governance. Promotor: Johan P. Hattingh, Co-promotor: Wouter Achterberg, University of Amsterdam. Voges is now in the office of Health and the Environment, Shell Oil Company, The Hague, Netherlands. (v.10,#1)

Voges, Ian F., "Environmental Management: Implementing the Paradigm Shift," Global Strategies for Environmental Issues, NAEP 19th Annual Conference Proceedings. Washington, DC: NAEP (National Association of Environmental Professionals) Publications, 1994, pages 266-276. Environmental managers can only incorporate efficiency under their current management paradigm; they are unable to handle the recent values of sustainability and equity. This will require a new paradigm, one that places cost/benefit analyses in this larger perspective. Voges is in philosophy at the University of Stellenbosch, South Africa. (v5,#4)

Vogt, Kristiina A., et al., Forest Certification: Roots, Issues, Challenges, and Benefits. Boca Raton, FL: Lewis Publishers, 1999. 384 pages. \$ 90. Forest certification is widely accepted as a tool for identifying environmentally acceptable management of forests, both industrial and non-industrial. Five issues are typically missing: the scientific basis for certification standards; incorporation of social and natural system sustainability; the rationale for differing standards currently used to certify governmental, industrial, and non-industrial uses; the success of certification; the difficulty of certifying small landowners. All authors are at the Yale University School of Forestry and Environmental Studies. (v10,#4)

Voice, Paul. "What Do Animals Deserve?" South African Journal of Philosophy 14 (no. 1, February 1995): 34-38. The failure of contractarianism to assign substantive moral weight to the interests of non-human animals does not count against contractarianism as a moral theory. I show why contractarianism excludes animals from the moral domain, and go on to argue that, when proper attention is to paid to the scope of moral theory, it is easily seen why animals lack full moral standing. Voice is in philosophy at the University of South Africa (UNISA), P.O. Box 392, Pretoria 0001, Republic of South Africa. (v6,#1)

Volger, John, The Global Commons: A Regime Analysis. New York: John Wiley, 1995. 248 pages. \$69.95 £ 35. The global commons--the oceans, Antarctica, outer space, the atmosphere--present key problems for global environmental management. "Regime theory" applied to these areas that are beyond national control, with a critical review of these concepts. The Third Law of the Sea Convention, recent developments in the rules for Antarctica, the protection of the stratospheric ozone layer and the

development of a climate change regime. The author is at Liverpool John Moores University, UK. (v6,#4)

Vreeland, Russell H., Rosenzweig, William D., and Powers, Dennis, W., "Isolation of a 250 Million-year-old Halotolerant Bacterium from a Primary Salt Crystal," Nature 407(19 October, 2000):897-900; and commentary, Parkes, R. John, "A Case of Bacterial Immortality?" Nature 407(19 October 2000):844-845. Immortal bacterium? Well, anyway, the oldest living organisms known. Researchers claim to have isolated bacteria 250-million-years old from tiny water inclusions in salt crystals in what was an inland sea, now New Mexico. The bacterium, in the genus Bacillus, was revived and cultured, even DNA sequenced. It is related to present day bacteria in the Dead Sea. Earlier reports have been of bacteria in bees in amber, 25-40 million years ago; other, older claims had been doubted, due to contamination. Mechanisms by which the biopolymers within it were kept from degeneration are unknown, nor, with discovery, whether bacteria need to die at all. (EE v.12,#1)

In German. Natur und Kultur 2 (no. 1, 2001):33-54. Abstract: In a sustainable world, we should live on the interests of the planet's natural capital. However, increasing evidence suggests that humanity's ecological demand is exceeding the regenerative capacity of the biosphere. The expanding global economic activities exacerbate this trend, particularly since they allow the rich countries to overcome the constraints imposed by the limited productivity of their national ecosystems. This path of ecologically unbalanced globalization, however, will lead humanity into an impasse, since not all nations can be net-importers of ecological capacity. (v.12,#2)

Wade, Nicholas, "Wasp Works Its Will on a Captive Spider," New York Times (7/25/00). Parasitic wasp larva gets spider to build web for it. A parasitic wasp lays its egg on the abdomen of an orb-weaving spider. For two weeks the growing larva sucks juices that drip from small punctures in the spider's body as the spider continues to rebuild each day its fragile circular web. On the night before the wasp larva kills its host, the spider builds a totally different web that is much stronger and serves as a platform from which the larva can safely hang its cocoon. When scientists remove the larva from the spider on what would have been the final evening, the spider builds the platform-style web for two nights and then resumes making its usual orb. (v.11, #4)

Wade, Nicholas, "From Ants to Ethics: A Biologist Dreams of Unity of Knowledge," New York Times, May 12, B9, B10. A promotion piece for Edward O. Wilson's new book, Consilience. "The kind of unification he (Wilson) proposes is the outright intellectual annexation that occurs when one field of knowledge becomes explainable in terms of a more fundamental discipline." "Dr. Wilson has resurrected it (consilience) as the slogan for a program of unrivaled ambition: to unify all the major branches of knowledge--sociology, economics, the arts and religion (and ethics and philosophy) under the banner of science and in particular of the biology that has shaped the human mind." Waelbers, Katinka, Frans Stafleu and Frans W.A. Brom, "Not All Animals Are Equal: Differences in Moral Foundations for the Dutch Veterinary Policy on Livestock and Animals in Nature Reservations," Journal of Agricultural and Environmental Ethics 17(2004):497-515. The Netherlands is a small country with many people and much livestock. As a result, animals in nature reservations are often living near cattle farms. Therefore, people from the agricultural practices are afraid that wild animals will infect

domestic livestock with diseases like Swine Fever and Foot and Mouth Disease. To protect agriculture (considered as an important economic practice), very strict regulations have been made for minimizing this risk. In this way, the practice of animal farming has been dominating the practices of nature management completely.

If, for instance, Foot and Mouth Disease strikes an agricultural area, all wild pigs and cattle living in the nearby nature reservations have to be killed, whether infected or not. This dominant position of one practice over the other has now become problematic. While the morality of the practice of nature management seems to be very different from the morality of agriculture and agriculture has become less important from an economic point of view, the public as well as those involved in nature management no longer seem to accept the dominant position of agriculture. Accompanied by a field study with in-depth interviews. Keywords: animal welfare, foot and mouth disease, nature management, wilderness. The authors ate at the Centre for Bio-ethics and Health Law, Utrecht University, The Netherlands,

Wagle, Subodh. "TNCs as Aid Agencies? Enron and the Dabhol Power Plant", The Ecologist (1979) 26(no. 4,1996):179. TNCs are increasingly trying to portray themselves as the most efficient vehicles for achieving "development". Public money allotted for development assistance, they assert, should be provided instead as loans to the private sector. The case has been put most explicitly by the Enron Corporation, the US multinational now building the controversial Dabhol Power Plant in Maharashtra, India. Far from "bringing development", however, the TNCs are standard bearers for a new colonialism.

Wagner, Andreas, Robustness and Evolvability in Living Systems. Princeton, NJ: Princeton University Press, 2005. Wagner will convince even the most skeptical reader that robustness to perturbation is a pervasive aspect of biology. A cautionary note for those enamored with all the disequilibrium, chaos, and other upsets in ecosystems. The routes to such stability may differ, and some stable solutions may be impossible, since they cannot be reached without instability. Wagner is a computation and theoretical evolutionary biologist at the University of New Mexico.

Wagner, Peter J., Matthew A. Kosnik, and Scott Lidgard. "Abundance Distributions Imply Elevated Complexity of Post-Paleozoic Marine Ecosystems." *Science* Vol. 314, no. 5803 (24 November 2006): 1289-91. Commentary on "Life's Complexity Cast in Stone" by Wolfgang Kiessling (*Science* Vol. 314, no. 5803 (24 November 2006): 1254-55.) The fossil record shows that since the end of the Paleozoic era, the structure of marine communities has become more complex. Biologists have the general impression that ecological communities get more complex, but lack adequate ways of measuring objectively different kinds of complexity. These authors propose such measurements. Complex distributions are essentially those in which the dominant taxa add ecological opportunity space. The big surprise, they say, is a major difference between Paleozoic (older than 250 million years) and younger communities. Complexly structured assemblages are substantially more common in more recent times.

Waks, Leonard J. "Environmental Claims and Citizen Rights," Environmental Ethics 18(1996):133-148. I propose a model for the development of citizen rights based on the advance of political and social rights and apply it to contemporary claims regarding environmental rights. In terms of this 'claims and attenuations' model, I sketch the roles of environmental philosophers and activists, the media and public opinion, and political insiders in the development of positive rights. I then predict a weakening of environmental claims and a marginalization of environmental philosophies as environmental claims are secured as positive rights. Waks is in Educational Leadership and Policy Studies, Temple University, Philadelphia. (EE)

Walck, Christa, Strong, Kelly C. "Using Aldo Leopold's Land Ethic to Read Environmental History: The Case of the Keweenaw Forest", Organization and Environment 14 (No. 3, September 2001) pp.261-89. Aldo Leopold's land ethic provides a useful conceptual framework for interpreting environmental histories, which may in turn be used to plan more effective future land use policies. The authors use a Leopoldian framework as a heuristic device to interpret the environmental history of the land in one small place – the Keweenaw Peninsula of Northern Michigan – where successive human purposes altered the landscape dramatically over time. This article identifies the historical role that power relations and the land ethic have played in land use and land health. The article concludes by identifying the need for community action based in a land ethic to maintain a healthy forest through sustainable use. Although it is unlikely the Keweenaw forest will return to its preindustrial state, the community can aim for a forest that exemplifies Leopold's qualities of integrity, stability, productivity and beauty. Walck and Strong are in management at Michigan Technological University. (v.13,#2)

Wall, James M., "Expanding our Identification Horizons," Christian Century, August 7-14, 1991. We need to be able to empathize far beyond our immediate circle. One sign of this is the growing interest in environmentally friendly products. The Wall Street Journal, extrapolating from the sense of guilt over disposable diapers, predicts that by the year 2000 it will be very difficult to sell products that are not environmentally responsible. (v2,#3)

Wallace, Aurora, "Missing Twins," Philosophy and Geography 5 (No. 1, 2002): 13-17. Contribution to a symposium on the events of September 11, 2001 in New York City. Wallace is in the Department of Culture and Communications at New York University. (P&G)

Wallace, George N., "Law Enforcement and the `Authority of the Resource,'" Legacy: Journal of the National Association for Interpretation 1(no. 2, October/November, 1990):4-8. Moral and behavioral appeals based on the authority of law versus appeals based on respect for nature. "Wild nature can be said to have its own authority. Nature has her own rules, operates in certain ways; there are consequences when we violate that order. ... Desirable behavior is more likely to occur if people understand how their actions affect the way nature operates." "Once the person understands what is happening in nature, or in the wilderness experience of others, ... they will want to stop what is recognized as undesirable behavior." Wallace is in the Department of Recreation Resources at Colorado State University. (v2,#1)

Wallace, Mark I., "The Wild Bird Who Heals: Recovering the Spirit in Nature," Theology Today 50 (no. 1, 1993):13-28. The Bible's creation hymns teach us that we are earth creatures, mud people, molded by the cosmic potter out of the clay of earth. But many of us in the postmodern West construe ourselves differently as denizens of a shopping-mall, temperature-controlled, throw-away world in which we have little need for reidentification with the primitive soil of our ancestral origins. Others, however, hunger for a renaturalized Christianity where the palpable sense of divine presence can be touched and tasted and heard and smelled in the push and pull of natural beings and forces. Wallace is in religious studies at Swarthmore College. (v5,#4)

Wallace, Mary G., Cortner, Hanna J., and Burke, Sabrina, "Taming Nature: The Enlightenment's Legacy for the Future," Journal of Forestry 94(Nov., # 11, 1996):39-44. The very ideals of the Enlightenment--reason and science--at times have been destructive, especially in their treatment of the natural world. America's Western frontier was a geographic testing ground for Enlightenment thought. Forestry as applied science is overshadowed by this worldview. We need new theoretical principles that retain the best of the Enlightenment thought but discard its dark sides. Critical theory can greatly help. With much citation of M. Horkheimer and T. Adorno, J. Dryzek. Rather surprising to see critical theory applied to forestry. The authors are associated with the Water Resources Research Center, University of Arizona. (v9,#1)

Wallach, Bret, At Odds With Progress: Americans and Conservation (Tempe: University of Arizona Press, 1991). Conservation in America is a distinctively American expression of an almost universal uneasiness about the character of the modern world. Environmental conservation strikes far deeper than the technical concerns of specialists. Those who care about the natural world should confess it, instead of hiding forever behind the masks of utility or compassion or even science. Wallach is a geographer. (v2,#1)

Wallach, Bret, At Odds with Progress: Americans and Conservation. 255 pages, \$ 24.95. Tuscon: University of Arizona Press, 1991. How ambivalence toward progress is a distinctively American expression of uneasiness about the character of the modern world. (v2,#4)

Waller, Bruce N., The Natural Selection of Autonomy (Albany, NY: State University of New York Press, 1998). 193 pages. \$ 18.00 paper. Challenges the traditional assumption that autonomy, morality, and moral responsibility are uniquely human characteristics. Genuine open alternatives are valuable for providing adapted fit for both for humans and other animals, and human reason strengthens, rather than creates, autonomous behavior. Waller finds the evolution of autonomous moral behavior in many species, including but not limited to, human animals. Waller is in philosophy, Youngstown State University. (v.9,#3)

Waller, David, "A Vegetarian Critique of Deep and Social Ecology," Ethics and the Environment 2(1997):187-197. For all their antagonism, deep and social ecology do share at least this much: a lack of interest in the issues of animal rights, animal welfare, and vegetarianism. I argue that this disinterest is inconsistent with deep and social ecology's practical programs and philosophical foundations. Furthermore, while they ignore the animals' case for special moral recognition, both schools nevertheless exploit our special feelings (pro and con) toward animals in order to advance their own agendas concerning nature. Waller teaches philosophy at California State University, Fullerton. (E&E)

Wallington, Tabatha J., Richard J. Hobbs and Susan A. Moore, "Implications of Current Ecological Thinking for Biodiversity Conservation: A Review of the Salient Issues," Ecology and Society 10: 15 (1 September 2005). A paradigm shift has occurred in ecology, from equilibrium thinking to non-equilibrium thinking, but this is not represented in management decisions for conservation. Part of the problem is that field observations have yet to provide compelling evidence for many of the relationships suggested by non-equilibrium ecology. Part of the problem is how radical the new paradigm is, since many of the claims of old ecology are still true at certain times, places, and scales. Nevertheless, non-equilibrium ecology ought increasingly be applied to management. One result favors more hands-on management and recognition that humans and nature are more entwined than before. Wallington is in social science, University of Queensland, Moore in environmental science, Murdoch University, Australia. Online. URL: <http://www.ecologyandsociety.org/vol10/iss1/art15/>

Waltner-Toews, David, "One Ecosystem, One Food System: the Social and Ecological Context of Food Safety Strategies", *Journal of Agricultural and Environmental Ethics* 4(1991):49-59. Eating is the most intimate relationship people can have with their environment. As people have migrated, in very large numbers, from various parts of the globe, as well as from the countryside to the city, they have brought to their new homes not only their intimate familial relationships, but also their intimate environmental relationships. Intra- and inter-national trade in human foods and animal feeds amounting to billions of dollars annually support these transplanted eating habits. Infectious disease agents, toxins and

environmental contaminants of all sorts are globally distributed along with these foods. Furthermore, the internationalization of a substantial portion of the food industry, along with urbanization, has resulted in unrealistic consumer perceptions of food, and fostered ecologically and socially unsound food production and food safety practices, which themselves are creating new food safety problems. Effective food safety strategies, which by necessity must account for the contamination of the environment in which the food is grown, as well as the environments through which it passes on the way to the consumer, need to be global in both breadth (socially and geographically) and depth (ecologically). As well, the desire for democratic social control now evident throughout the world, along with this diversity of culinary tastes, suggest that a successful global food safety strategy would do well to reflect the kinds of diversity and complex interactions seen in natural ecosystems.

Waltner-Toews, David, James J. Kay, and Nina-Marie E. Lister. *The Ecosystem Approach: Complexity, Uncertainty, and Managing for Sustainability*. New York: Columbia University Press, 2008. This book is directed toward engineers, scientists, and sustainable development scholars and practitioners who are sympathetic to the Resilience Alliance—an international group of scientists who adhere to a holistic view of ecology and environmental problem solving. Using a variety of case studies, the authors discuss ecosystems ecology, the relationship between science and values, governance in complex systems, participatory and systematic approaches to management, and the role of cultural diversity in global sustainability.

Forestry management policies in China have changed direction to encourage sustainability while balancing land-use, economic growth, and demand for forest products. Past government policies have favored economic growth over the environment, but the central government has now proposed a science-based approach designed to realize balanced sustainable development. However, in practice, local governments continue to put economic growth ahead of any concern for the environment, which has led critics to call for stronger governmental control.

Ward, Bruce K., "Christianity and the Modern Eclipse of Nature: Two Perspectives," *Journal of the American Academy of Religion* 63(1995):823-843. Fyodor Dostoevsky is compared with Albert Camus. Both have a shared affirmation of the spiritual significance of nature, but there are revealing differences. Dostoevsky affirms nature's sanctity and presents it as compatible with Christianity and inseparable from it. Camus claims that Christianity, far from containing within itself a possible corrective to the modern denaturation of the world, has contributed to it. There is a tension between love of beauty in nature and love of neighbor. Ward teaches religious studies at Thorneloe College, Laurentian University, Sudbury, Ontario.

Warner, Daniel M., "No Place of Grace: Recognizing Damages for the Loss of Home-Place," 8/2 Wisconsin Environmental Law Journal 3 (Spring 2002). A significant cause of the present disastrous state of the environment is our culture's refusal to recognize the value of place. In this paper it is argued that the loss or taking of one's home-place by another is the disruption of a sustaining and nurturing relationship--that homesickness is real. The law recognizes that compensation for loss of consortium, for the loss of the "intangible elements of a marriage relationship" is appropriate--such a loss is a kind of emotional distress. Similarly, damages should be awarded in case of the loss of one's home-place, and those damages should not be limited to the market-value of the place. (v 14, #3)

Warner, Joan, et al., "The Atlantic Century?" Business Week, February 8, 1999, pp. 64-67, and related stories. Once again, the U.S. and Europe are the twin drivers of the world economy. Experts once predicted that the opening world markets would be global; capitalism would open up into a unified system, enriching all nations. But not so. North America and Europe are the global anchors of prosperity and stability, while the rest of the world struggles in economic limbo. Europe is emerging as an equal to the United States, especially with the euro, the common currency, and a market (\$ 6.5 trillion, 9,100 listed companies) nearly the size of the U.S. market (\$ 8 trillion, 9,900 listed companies). The euro will soon become the equal of the dollar. But while North America and Europe increasingly look like twin pillars of global growth, the former stars of the world economy are in a tailspin. Japan is no longer a growth engine for Asia; China is more self-obsessed and protectionist. Nor does it seem that North America and Europe need the rest of the world for growth, so much as was once thought. The new divide between the haves and the have nots could be self-perpetuating; the rich will get richer and the poor poorer. (v.10,#1)

Warner, Keith Douglass. "Are Life Patents Ethical? Conflict Between Catholic Social Teaching and Agricultural Biotechnology's Patent Regime." Journal of Agricultural and Environmental Ethics 10(2001):301-319. Patents for genetic material in the industrialized North have expanded significantly over the past twenty years, playing a crucial role in the current configuration of the agricultural biotechnology industries, and raising significant ethical issues. Patents have been claimed for genes, gene sequences, engineered crop species, and the technical processes to engineer them. Most critics have addressed the human and ecosystem health implications of genetically engineered crops, but these broad patents raise economic issues as well. The Catholic social teaching tradition offers guidelines for critiquing the economic implications of this new patent regime. The Catholic principle of the universal destination of goods implies that genes, gene sequences, and engineered crop varieties are ineligible for patent protection, although the processes to engineer these should be eligible. Religious leaders are likely to make a more substantive contribution to debates about agricultural biotechnology by addressing these life patents than by speculating that genetic engineering is "playing God." Keywords: agricultural biotechnology, Catholic social teaching, economic justice, genetically modified food, patents, patents on life, patent regimes, social ethics. Warner is in the Department of Environmental Studies, University of California, Santa Cruz, Santa Cruz, CA. (JAE)

Warner, Melanie, "California Wants to Serve a Warning With Fries," New York Times, Sept. 21, 2005. <http://www.nytimes.com/2005/09/21/business/21chips.html?pagewanted=print>

The California attorney general filed suit against McDonalds, Burger King, and Frito-Lay, saying that they should be forced to put labels on all fries and chips warning of danger to health. French fries are the most consumed food in restaurants, soaked with trans fats, loaded with sodium and full of simple carbs, the bad kind. They are also full of a chemical called acrylamide, known to cause cancer in rats and mice--but not known to cause cancer in humans at the levels in French Fries. The U.S. Food and Drug Administration (F.D.A.) opposes the labelling on grounds that its investigation of the issue is incomplete.

Warner, Sara, Down to the Waterline: Boundaries, Nature, and the Law in Florida. Athens: University of Georgia Press, 2005. Do our rights end--or begin--at the water's edge? Analysis of the boundary separating public waters from private uplands. How advances in science and environmental attitudes have led to a more complex encounter with this ancient boundary. Public access and private ownership limits on some of Florida's most valuable land in economic terms, waterfront real estate, and, in ecological terms, marshes and wetlands.

Warner, Sara. *Down to the Waterline: Boundaries, Nature, and the Law in Florida*. Athens: University of Georgia Press, 2007. The boundary separating public waters from private uplands is a flashpoint between proponents of property rights and proponents of public trust protection. Coasts and the interior shorelines, and the wildlife and birds, are caught in the controversy.

Warner, Stanley, "Reproductive Liberty and Overpopulation: A Response," Environmental Values 13(2004):393-399. This appraisal of Carol A. Kates' "Reproductive Liberty and Overpopulation" challenges her call for world-wide population control measures - using compulsory methods if necessary - to save the world's environment. The most successful part of Kates' paper is her argument that reproductive rights are not infeasible and nonnegotiable, but that like many rights, they are conditional and open to a balancing of individual freedom against collective community interests. But her advocacy of mandatory state population controls is flawed in several respects. First, she underestimates the force of the emerging consensus for voluntary population reductions through policies that empower women. Second, she walks on difficult ethical grounds. Are compulsory controls on reproduction ethically justified simply because humans are loathe to take the alternative route of curtailing their 'individualistic' 'materialistic' appetites for more economic growth and consumption? Third, Kates fails to recognise that her search for measures that immediately and directly reverse population growth would necessitate coercing an entire generation of women toward zero reproduction in order for death rates to have their effect. Lastly, problems with the feasibility of her plan and the absence of international support make it unlikely it will ever come to pass. Alternatives to Kates' policies are discussed at the close. Warner is in social science, Hampshire College, Amherst, Massachusetts. (EV)

Warner, Stanley; Feinstein, Mark; Coppinger, Raymond; and Clemence, Elisabeth, "Global Population Growth and the Demise of Nature," Environmental Values 5(1996):285-301. Global human population expansion is rooted in a remarkably successful evolutionary innovation. The Neolithic transformation of the natural world gave rise to a symbiosis between humans and their domesticated plant and animal partners that will expand from a current 20 per cent to 60 percent of terrestrial biomass by the middle of the coming century. Such an increase must necessarily be accompanied by a concomitant decrease in wildlife biomass. We suggest that current trends in population growth are unlikely to abate for three reasons: first, there are intrinsic biological pressures to reproduce regardless of social engineering. Second, the character of the domestic alliance makes it a formidable competitor to wildlife; and third, the time frame before population doubling is, from a biological perspective, virtually instantaneous. We neither condone nor endorse this picture of inexorable population increase. Rather, we appeal for a change in the nature of the discussion of population among environmentalists, to focus on the question of

how best to manage what wildlife will be left on the margins of a domesticated world. (EV)

Warren, Karen J. "The Power and the Promise of Ecological Feminism." Environmental Ethics 12(1990):125-46. Ecological feminism is the position that there are important connections--historical, symbolic, theoretical--between the domination of women and the domination of nonhuman nature. I argue that because the conceptual connections between the dual dominations of women and nature are located in an oppressive patriarchal conceptual framework characterized by a logic of domination, (1) the logic of traditional feminism requires the expansion of feminism to include ecological feminism and (2) ecological feminism provides a framework for developing a distinctively feminist environmental ethic. I conclude that any feminist theory and any environmental ethic which fails to take seriously the interconnected dominations of women and nature is simply inadequate. Warren is in the philosophy department, Macalester College, St. Paul, MN. (EE)

Warren, Karen J. "Environmental Justice: Some Ecofeminist Worries about a Distributive Model." Environmental Ethics 21(1999):151-161. I argue that the framing of environmental justice issues in terms of distribution is problematic. Using insights about the connections between institutions of human oppression and the domination of the natural environment, as well as insights into nondistributive justice, I argue for a nondistributive model to supplement, complement, and in some cases preempt the distributive model. I conclude with a discussion of eight features of such a nondistributive conception of justice. (EE)

Warren, Karen J. "Feminism and Ecology: Making Connections." Environmental Ethics 9(1987):3-20. The current feminist debate over ecology raises important and timely issues about the theoretical adequacy of the four leading versions of feminism--liberal feminism, traditional Marxist feminism, radical feminism, and socialist feminism. I present a minimal condition account of ecological feminism, or eco-feminism. I argue that if eco-feminism is true or at least plausible, then each of the four leading versions of feminism is inadequate, incomplete, or problematic as a theoretical grounding for eco-feminism. I conclude that, if eco-feminism is to be taken seriously, then a transformative feminism is needed that will move us beyond the four familiar feminist frameworks and make an eco-feminist perspective central to feminist theory and practice. Warren is in the philosophy department, Macalester College, St. Paul, MN. (EE)

Warren, Mary Anne, "The Moral Status of Nonhuman Life." Pages 370-385 in James P. Sterba, ed., Social and Political Philosophy: Contemporary Perspectives (London: Routledge, 2001). Sterba bridges anthropocentric and biocentric forms of environmental ethics with a compromise. He accords moral status to all living organisms, as well as to species and ecosystems, but retains a limited preference for human over nonhuman interests. I agree with this strategy, but disagree with the way in which his principles treat all nonhuman organisms as having essentially the same moral status. I argue that organisms of different species often differ in moral status, both because of differences in their intrinsic value, and because of their different relationships to human beings and terrestrial ecosystems. Warren is in philosophy at San Francisco State University. (v.12,#3)

Warrick, Joby, "A Growing Approach To Saving Songbirds," Washington Post (1/4/99). Shade-grown coffee protects songbirds. Your morning cup of coffee may be contributing to the demise of the birds you listen to as you sip. The latest in environmentally-correct consumption involves buying specialty coffee grown in the shade of trees that are important habitat for migratory songbirds such as the wood thrush, Baltimore oriole, and numerous species of warbler. The U.S. coffee demand has skyrocketed. The U.S. now consumes one-third of the world's coffee; it is the No. 3 import after oil and steel. In order to meet the increased demand, farmers have been cutting the trees under which coffee bushes have traditionally been grown and using direct sunlight and chemicals to increase the yield. With the decline in rainforests, coffee plantations have become an increasingly important habitat (accounting for half the land cover in some Central American provinces). Currently none of the larger national coffee chains or food retailers market bird-friendly, 100 percent shade-grown coffee. Starbucks' consumer hotline is: 1-800-23-latte. (v.10,#1)

Warrick, Joby, "White House Predicts Low Cost for Pact on Warming," Washington Post (3/4/98): A1. See write up under: Hamilton, Martha, "Global Warming Gets a 2nd Look," Washington Post (3/3/98): C1. (v9,#2)

Warrick, Joby, "120 Countries to Try to Reach Pact On Phaseout of Toxic Compounds," Washington Post (6/28/98): A3. Worldwide phaseout of some toxic chemicals? In early July, 120 countries met in

Montreal to work on a U.N. treaty to phase out 12 chemicals including DDT, dioxins, and PCBs. These "persistent organic pollutants" travel long distances and concentrate in animal tissues. They are found in the bodies of marine creatures and humans thousands of miles from industrial centers. Levels of the toxins have remained constant for more than a decade, even though production of most have been banned in Western Countries for a quarter-century. At high levels, the chemicals damage the central nervous system, suppress immune responses, and disrupt reproductive systems. The World Wildlife Fund recently published a study suggesting a possible link between these chemicals and the recent die-offs of marine mammals. In developing countries, DDT remains the pesticide of choice in the fight against malaria, a major public health threat that kills almost three million people a year. The World Health Organization continues to endorse DDT as a "most valuable tool" for controlling malaria. (v9,#2)

Warrick, Jody, "Whose Shade of Green?" Washington Post (4/21/97): A1. Critics of environmental education making headway. Critics who charge that much environmental teaching is biased are fighting back with a new book and with industry-sponsored seminars on environmental education. Michael Sanera's "Facts Not Fear: A Parent's Guide to Teaching Children About the Environment" makes the case that many who teach about the environment are engaged in advocacy rather than instruction and that environmental education in general is teaching children slogans and dogma, rather than getting them to think critically about the environment. Companies are presenting seminars that promote industry-developed classroom materials. One brochure produced by Exxon touted the advantages of gasoline powered over electric vehicles. In response to these criticisms, Arizona has abolished mandatory environmental study in public schools and turned control of funds for environmental education over to loggers's and cattlemen's associations. (v8,#2)

Warrick, Jody, "U.N. Summit Reaches an Ineffectual End," Washington Post (6/28/97) A3; and Peter Baker and Paul Blustein, "Discord on Pollution Strains United Front as Summit Concludes," Washington Post (6/23/97): A1. Rio Plus Five falls flat. A meeting in New York City of 180 countries and 44 heads of state convened to assess progress in meeting goals of the 1992 Rio de Janeiro Earth Summit was marked by charges that the North was refusing to honor aid commitments to poorer countries of the South and criticism of the U.S. for refusing to agree to specific targets for reducing emissions of CO₂, the major greenhouse gas. The leaders failed to agree on a final political statement expressing global resolve to fight pollution. Some developing countries were blocking the agreement to protest the West's failure to honor aid commitments. Fierce criticism was directed at the U.S. for refusing to go along with a European proposal to reduce CO₂ emissions by 15 percent below the world's 1990 output by the year 2010. At a meeting in Denver of the major industrial powers the previous week, French President Jacques Chirac said "The Americans are great polluters when it comes to carbon dioxide. The average American emits three times the amount of carbon dioxide pollution as the average Frenchman." (Overall, the U.S. produces a quarter of world's greenhouse gases.) The Clinton administration is suggesting that the European goal may not be realistic and says it will propose specific targets to be included in a global warming treaty to be signed at an international meeting scheduled for December in Kyoto, Japan. Watkins, Kevin. "Free Trade and Farm Fallacies: From the Uruguay Round to the World Food Summit," The Ecologist 26(no.6, 1996):244. Free trade is increasingly considered to be the best way of ending world hunger. The removal of trade barriers, it is argued, will allow countries to "reap the benefits of comparative advantage" and enable domestic consumption to be met more cheaply by less costly imported supplies. But while Southern countries have been obliged under the Uruguay Round of GATT to remove subsidies to their farmers, subsidies to Northern producers remain intact. Far from relieving hunger, liberalization is increasing food insecurity by throwing Southern producers into unequal competition with the heavily-subsidized, capital-intensive agricultural systems of the North. Millions of livelihoods will be lost as a result. An alternative trade agenda is urgently required--one that promotes greater food self-sufficiency in the South, with a focus on smallholder producers, and that accepts the need to restrict imports in the interests of tackling the underlying causes of hunger. The species' relationships in a variety of habitats. (v8,#3)

Watson, Lyall, Dark Nature--A Natural History of Evil. New York: HarperCollins, 1995. A study of the dark side of nature, made in biological terms--not from the top down, but from the bottom up. The usual (top-down) accounts of evil events and behavior that are given in religion, philosophy, and ethics fail, not because they underestimate evil, but because they misunderstand its nature. Evil is commonplace and widespread, perhaps not even confined to the human species, although it is all too easy to leap to unwarranted conclusions, particularly where other species are concerned. In evolutionary history, organisms make themselves, always a creative advance into novelty, and evil is a part of this scheme of things. It is part of the ecology of life, casting its shadow on everything that we do. As we humans choose our future, we have to understand a dark side to our own nature; but just this capacity to choose makes us special, giving us the ability to select a course for nature, instead of just submitting to the course of natural selection. (v10,#4)

(v.11,#1)

Watson, Paul, Seal Wars: Twenty-Five Years on the Front Lines with the Harp Seals. Buffalo, NY: Firefly Books, 2003. Paul Watson has spent 25 years trying to end the seal "hunt," especially the clubbing of baby seals. Clubbing baby seals has been reduced, but killing of seals after they are a few weeks old continues. Watson has himself been clubbed until he was unconscious, and dragged across sharp ice and released to flounder in ice-cold seas. Americans banned importing harp seal pelts in 1972: the European Economic Community banned whitecoat pelts in 1983. Canada banned the baby seal hunt

in 1988, though only until their white coats begin to molt and turn silvery grey, about two weeks after birth. Canada still has a 975,000 kill quota for "adult" seals, arguing that the seals eat codfish and harm the industry. Watson replies that the codfish depletion is due to massive drag trawler fleets. Seal hunters come primarily from Newfoundland, commercial hunters supplying the fur industry. Although the EU bans importing pelts, the demand for seal pelts is growing in Norway, Denmark, and much of Europe. Watson was a founder of Greenpeace, and later broke with Greenpeace to found his more aggressive Sea Shepherd Society.

Watson, Paul, Ocean Warrior: My Battle to End the Illegal Slaughter on the High Seas. St. Leonards, NSW, Australia: Allen and Unwin, 1994. 264 pages. Watson's account of his efforts through the Sea Shepherd Conservation Society, which include many episodes of civil disobedience in defense of whales, seals, dolphins, and other creatures of the sea. The Canadian government once brought charges that might have sent Watson to prison for life, spending some \$ 4 million to press the charges. The charges were dismissed, except that he was fined \$ 35 for a misdemeanor. Watson was at once time with Greenpeace, but left to pursue more aggressive civil disobedience, and he has sunk quite a number of (illegal) whaling ships, though claims never to have physically harmed a person. (v6,#4)

Watson, R.T.; Zinyowera, M.C.; and Moss, R.H. Climate Change 1995--Impacts, Adaptations and Mitigation of Climate Change: Scientific-Technical Analyses. New York: Cambridge University Press, 1996. 890 pages. \$95 cloth, \$35.95 paper. In this report from Working Group II of the Intergovernmental Panel on Climate Change, the lead authors and contributors assess just how these changes will impact on earth systems, how the earth will adapt to the increase in greenhouse gases and what mitigation options are available. Watson, Richard A., "Some Philosophical Problems in Environmental Ethics," Philosophical Inquiry 11(nos. 1-2, Winter-Spring 1989):1-16. "Logical problems, philosophically unsupported arguments, and disturbing social implications in four areas of environmental ethics: (1) eco-philosophy, ecosophy, or deep ecology; (2) eco-religion, ecomysticism, and eco-morality; (3) anti-anthropocentrism and anti-humanism; and (4) the rights of nonhuman animals, nonsentient nature, and abstract corporate entities."

"The environmental ethics literature is ... shot through with examples of the naturalistic fallacy" (p. 11)
"A substantial amount of what goes on in the literature of environmental ethics is either in ignorance of or in outright defiance of much that has been accomplished in philosophy since the Enlightenment" (p. 14).
"Value enters the world only under the scope of the interests, intentions, and actions of self-conscious entities" (p. 12). Watson teaches philosophy at Washington University, St. Louis.

Watson, Richard A. Review of The Fate of the Earth. By Jonathan Schell. Environmental Ethics 6(1984):181-84.

Watson, Richard A. "A Critique of Anti-Anthropocentric Biocentrism." Environmental Ethics 5(1983):245-56. Arne Naess, John Rodman, George Sessions, and others, designated herein as ecosophers, propose an egalitarian anti-anthropocentric biocentrism as a basis for a new environmental ethic. I outline their "hands-off-nature" position and show it to be based on setting man apart. The ecosophic position is thus neither egalitarian nor fully biocentric. A fully egalitarian biocentric ethic would place no more restrictions on the behavior of human beings than on the behavior of any other animals. Uncontrolled human behavior might lead to the destruction of the environment and thus to the extinction of human beings. I thus conclude that human interest in survival is the best ground on which to argue for an ecological balance which is good both for human beings and for the whole biological community. Watson is in the philosophy department, Washington University, St Louis, MO. (EE)

Watson, Richard A. "A Note on Deep Ecology." Environmental Ethics 6(1984):377-79.

Watson, Richard A. and Philip M. Smith. "New Wilderness Boundaries." Environmental Ethics 1(1979):61-64. Wilderness is not a simple geographic concept and the boundaries of wilderness can never be simple geographic lines. Wilderness boundaries depend on attitudes and appearances as much as on the physical environment. Many areas and forms of wilderness should be protected and included within the National Wilderness Preservation System with specialized designations in terms of wilderness experience. Watson is in the philosophy department, Washington University, St. Louis, MO. Smith was formerly with the Office of Science and Technology Policy, Executive Office of the President, Washington, DC.

Watson, Richard A. "Self-Consciousness and the Rights of Nonhuman Animals and Nature." Environmental Ethics 1(1979):99-129. A reciprocity framework is presented as an analysis of morality, and to explain and justify the attribution of moral rights and duties. To say an entity has rights makes sense only if that entity can fulfill reciprocal duties, i.e., can act as a moral agent. To be a moral agent an entity must (1) be self-conscious, (2) understand general principles, (3) have free will, (4) understand the given principles, (5) be physically capable of acting, and (6) intend to act according to or against the given principles. This framework is foundational both to empirical and supernatural positions which distinguish a human milieu, which is moral, from a nonhuman milieu, which is not. It also provides a

basis for evaluating four standard arguments for the rights of nonhuman animals and nature--the ecological, the prudential, the sentimental, and the contractual. If reciprocity is taken as being central to the general concepts of rights and duties, then few animals, and no natural objects or natural systems, have rights and duties in an intrinsic or primary sense, although they may be assigned them in an extrinsic or secondary sense as a convenience in connection with human interests. Nevertheless, there are some animals besides humans--e.g., especially chimpanzees, gorillas, dolphins, and dogs--which, in accordance with good behavioral evidence, are moral entities, and sometimes moral agents. On the grounds of reciprocity, they merit, at a minimum, intrinsic or primary rights to life and to relief from unnecessary suffering. Watson is in the philosophy department, Washington University, St. Louis, MO. (EE)

Wayne, Robert K. and John L. Gittleman. "The Problematic Red Wolf." Scientific American 273 (no. 1, July 1995):36-39. Is the red wolf a species or a long-established hybrid of the gray wolf and the coyote? Proving that the red wolf fits any of the traditional definitions of species has been extremely challenging. Studies of DNA fail to find diagnosable red wolf DNA sequences different from those of the coyote or gray wolf. The authors conclude that the red wolf is a hybrid and not a distinct species. Such distinctions may affect ongoing efforts to save a variety of endangered species, although the authors argue that there are, nevertheless, compelling reasons to continue protection of the red wolf. Wayne teaches biology at UCLA, Gittleman at the University of Tennessee.

Wearing, Stephen and Neil, John, "Refiguring Self and Identity Through Volunteer Tourism," Loisir et société, Society and Leisure (Presses de l'Université du Québec) 23 (no. 2, 2000):389-419. In English. "As we travel with ourselves we see the 'other' as a world we are travelling through; but at some stage does that 'other' become part of ourselves? This paper is then about that dialogue: interpersonality, boundaries, travel, self and nature. It focuses on the volunteer tourists, as they appear to best represent the type of tourist that allows us to examine this area" (p. 390). "Volunteer tourism applies to those

tourists who, for various reasons, volunteer in an organized way to undertake holidays that might involve aiding or alleviating the material poverty of some groups in society, the restoration of certain environments, or research into aspects of society and environment" (p. 394).

What is happening to the sense of self, the personal and community identity of tourists? More ordinary tourists tend to be "gazers," or "escapers," "Cartesians," "modernists." Ecotourists "interact" more significantly with nature and the local communities they visit, "embodied practice" (pp. 397-398). Ecotourists "are those who know that their future will be made of dialogue with their fellow travellers and those they meet along the way" (p. 395); this involves "postmodernized interactionism." They are "travelling to incorporate nature into the self" (p. 402). Environmental philosophers, especially ecocentrists and deep ecologists, can be of help understanding and facilitating this. Wearing is at the University of Technology, Sydney. Neil is at the University of Newcastle, UK. (v.13, #3)

Weatherall, David, and Helen Munn. "Moving the Primate Debate Forward." *Science* Vol. 316, no. 5822 (13 April 2007): 173. This editorial is about the recent United Kingdom report *The Use of Non-Human Primates in Research* of an independent group of scientists and nonscientists outside the primate research community that attempt to provide a better-informed basis for the debate. This report available through the UK Academy of Medical Sciences at: <www.acmedsci.ac.uk/image/project/nhpdownl.pdf>. The UK public accepts the need for animals in medical research, but dislikes the use of primates. No great apes have been used in research in the UK since 1986, so the report deals mostly with monkeys and their use in research in neurosciences, communicable diseases, vaccines for HIV/AIDS, tuberculosis, and malaria. Generally the conclusion is that blanket prohibition is unwise due to the complexity of developing research and uncertain needs for the future. Primate research needs to be minimized, but not ruled out. In a typically pro-science posture, the authors of the report say: "The public debate on nonhuman primate research needs to move forward on the basis of sound scientific reasons." Yes, but presumably however, no amount of sound scientific research will answer the ethical questions.

Weaver, S. A., and M. C. Morris, "Science, Pigs, and Politics: A New Zealand Perspective on the

Phase-out of Sow Stalls," Journal of Agricultural and Environmental Ethics 17(2004):51-66. Sows housed in stalls are kept in such extreme confinement that they are unable to turn around. In some sectors of the pork industry, sows are subjected to this degree of confinement for almost their entire lives (apart from the brief periods associated with mating). While individual confinement is recognized by farmers and animal welfare community organizations alike, as a valuable tool in sow husbandry (to mitigate against aggression), what remains questionable from an animal welfare point of view is the necessity to confine sows in such small spaces.

In 2001, the Australian Journal of Agricultural Research published a review article on the science associated with the use of the sow stall, and claimed "no scientific evidence to support the recommendation in the Code of Practice advising against housing of sows in stalls followed by housing in crates" (Barnett et al., 2001, p. 21). If all the available scientific publications on the animal welfare implications of sow stalls are consulted (many of which did not feature in the above review), then one will indeed find scientific evidence to support recommendations against the housing of sows in stalls. Because there is science on both sides of this policy divide, the argument to defend the use of sow stalls, therefore, is not one of science vs. public opinion, but one of ethics.

An analysis of the scientific arguments against the use of the sow stall should be used to encourage ethical debate on this issue. As an ethical debate, the issue of the use of the sow stall can then focus on the degree of suffering we as a society are willing to tolerate in agricultural practices, and the animal welfare costs associated with extreme economies of scale in sow stocking rates, rather than get bogged down in red herring debates over whether there is any suffering at all. Keywords: animal welfare, New Zealand, pigs, pork industry, sow stalls.

The authors are in Environmental Studies, School of Earth Sciences, Victoria University, Wellington, New Zealand. (JAEE)

Weaver, Sean A. and Michael C. Morris, "Risks Associated with Genetic Modification: An Annotated Bibliography of Peer Reviewed Natural Science Publications," Journal of Agricultural and Environmental Ethics 18(2005):157-189. An annotated bibliography of peer reviewed scientific research. Risks include concerns over resistance and non-target effects of crops expressing Bt toxins, consequences of herbicide use associated with genetically modified herbicide-tolerant plants, and transfer of gene expression from genetically modified crops through vertical and horizontal gene transfer. These risks are not connected to the technique of genetic modification as such, but would be present for any conventionally produced crops with the same heritable traits. In contrast, other risks are a direct consequence of the method used in gene manipulation. These come about because of the unstable nature of the transgene and vectors used to insert it, and because of unpredictable interactions between the transgene and the host genome. The debate over the release of genetically modified organisms is not merely a scientific one; it encompasses economics, law, ethics, and policy. Keywords: animal welfare - annotated bibliography - biotechnology - Bt - environment - genetic modification - GMOs - human health - risk assessment - transgene. The authors are in geography and earth science, Victoria University of Wellington, Wellington, New Zealand. (JAEE)

Weaver, Sean A., "Chronic Toxicity of 1080 and its Implications for Conservation Management: A New Zealand Case Study," Journal of Agricultural and Environmental Ethics 19(2006):367-389.

Sodium monofluoroacetate (1080) is a mammalian pesticide used in different parts of the world for the control of mammalian pest species. In New Zealand it is used extensively and very successfully as a conservation management tool for the control of brushtail possums (Trichosurus vulpecula) - an introduced marsupial that has become a substantial agricultural and conservation management pest. Possums pose a threat to cattle farming in New Zealand as they are a vector for bovine tuberculosis. In protected natural areas, possum browsing is responsible for large scale defoliation of native vegetation. As with many other pesticides, there has been some degree of popular concern about the use of this toxin and its safety, with particular reference to non-target effects. These concerns have been associated with potential non-target effects on human health, and the health of animals of recreational value (e.g., hunting

dogs and game animals). This has led to the development of a strong "anti-1080" lobby in New Zealand. In contrast, this study encompasses a science-based risk analysis focusing on the potential risks to non-target native wildlife with a particular focus on chronic toxicity. It finds that there is evidence that 1080 may have endocrine disrupting capabilities (with potential relevance for non-target wildlife) but that this still needs more detailed investigation. This can be clarified by further targeted research. Further research is also needed to test the degradation rates of 1080 and its breakdown products at ecologically-relevant temperatures (i.e., winter stream temperatures - below 11EC). Such research may demonstrate that some adjustment to 1080 risk management is warranted in New Zealand, or it may help to put to rest the current controversy over the use of this cost effective conservation management tool. Keywords: chronic toxicity - conservation - endocrine disruption - New Zealand - risk- Sodium monofluoroacetate (1080) - wildlife. Weaver is in Environmental Studies, School of Earth Sciences, Victoria University, Wellington, New Zealand.

Webb, L. J. and J. Kikkawa, eds., Australian Tropic Rainforests: Science--Values--Meaning. East Melbourne, Victoria: CSIRO Publications, 1990. 185 pages. 19 essays organized into sections on "The Depths of Time," "Natural Processes," "Value and Meaning," "Future Perspectives." Some sample essays: J. Davidson, "Values and Uses: Seeing the Forest Through Different Eyes"; I. Lowe, "Scientific Objectivity and Values"; D. A. Ratcliffe, "Conserving Wild Nature: Purpose and Ethics"; J. R. Engel, "Rainforest as Metaphor: The Search for Public Education in the Australian Wet Tropics"; M. Charlesworth, "Nature's Rights." An excellent mixture of science and conscience. Len J. Webb is with the Division of Environmental Sciences, Griffith University, Nathan, Queensland; Jiro Kikkawa is in the Department of Zoology, University of Queensland, St. Lucia. (v1,#4)

Webb, Stephen H., On God and Dogs: A Christian Theology of Compassion for Animals. New York: Oxford University Press, 1998. 222 pages. Animal welfare and Christian conviction. The emotional bond with companion animals should play a central role in the way we think about animals in general. Against the more extreme animal liberationists--Webb defends the intermingling of the human and the animal worlds. He imagines what it would be like to treat animals as a gift from God; indeed, animals are not only a gift to us, but they give to us. We need to attend to their giving and return their gifts appropriately. Webb teaches religion at Wabash College. (v.9,#4)

Webb, Stephen H., On God and Dogs: A Christian Theology of Compassion for Animals. New York: Oxford University Press, 1998. \$ 30.00. A Christian perspective on responsibilities to animals, the relationships between humans and their pets, particularly dogs. The relationship can and should inform broader opinions about animal welfare and moral obligations to all animals. (v.9,#3)

Weber, E., Lovrich, N. and Gaffney, M., "Collaboration, Enforcement, and Endangered Species: A Framework for Assessing Collaborative Problem Solving Capacity," Society and Natural Resources 18(no. 8, September 2005): 677-698.

--Whitfield, John, "Biogeography: Is Everything Everywhere?" Science 310(11 November 2005):960-961. Microbiologists have long thought that the same microbes are everywhere. "There is no biogeography for anything smaller than 1 millimeter" (Bland Finlay), partially because the microbes and spores are blown transcontinentally in the wind, partially because these can long lie dormant. But other microbiologists are now finding that some microbes are locally specific. One problem is that the species question is not well defined at the microbe level. Many assign microbes to different species only if their DNA is less than 97% identical, but the same criteria would put all primates from lemurs to humans in one species.

Weber, JR; Word, CS, "The Communication Process as Evaluative Context: What Do Nonscientists Hear When Scientists Speak?" Bioscience 51(no. 6, 2001):487-496. (v.13,#1)

Weber, Marcel, "The Aim and Structure of Ecological Theory," Philosophy of Science 66(1999):71-93. Law-like statements often play an important role in ecological theory, contrary to the views of such philosophers of science as Shrader-Frechette and McCoy, who argue that ecology can only be piecemeal, local case studies. "I show that there are ecological laws, if it is allowed that laws generalize over a restricted domain of application." The principle of competitive exclusion (that species with insufficiently differentiated fundamental niches cannot coexist at equilibrium) is such a law. Weber is at the Zentrale Einrichtung für Wissenschaftstheorie und Wissenschaftsethik, Universität Hannover, Germany. (v.10,#1)

Wee, Cecilia. "Cartesian Environmental Ethics." Environmental Ethics 23(2001):275-286. René Descartes is often thought to have exerted a pernicious influence on our views concerning the relationship of humans to the environment. The view that because animals are machines, "thoughtless brutes," they have no moral standing, and we thus have a right to use them to further our own interests, is attributed to him. A celebrated passage from the Discourse on Method adds fuel to the view that he subscribes to the "dominion" theory. I argue that this picture is misleading and unfair. Descartes does not hold the dominion theory, and there is evidence that he accords animals (and plants) moral standing. Most importantly, Descartes holds that it is a human good to subordinate one's interests to those of the larger universe. He can, in fact, be seen as a forerunner of modern ecocentrism. (EE)

Weidensaul, Scott, photographs by Mark Godfrey, "The Ivory-bill and its Forest Breathe New Life," Audubon 55(no. 2, 2005):20-31. The ivory-bill woodpecker, not seen (reliably) for over sixty years, has again been found in the Arkansas Mississippi delta (area of Cache River National Wildlife Refuge), in a location not precisely revealed to protect the bird.

Weigert, Andrew J., Self, Interaction, and Natural Environment: Refocusing Our Eyesight. Albany: State University of New York Press, 1997. An analysis of how we as individuals understand environmental issues and respond accordingly. Environmental issues exist on worldwide scale, but most people do not consider the pollution they cause by operating cars or fertilizing lawns. (v9,#1)

Weikard, Hans-Peter, "A Methodological Note on Ethics, Economics, and the Justification of Action", Journal of Agricultural and Environmental Ethics 5(1992):183-188. Two disciplines claim to provide justification of action. Ethics gives you moral reasons to act upon, whereas economics exploits the concept of rationality. The paper discusses two theories of interdisciplinarity of ethics and economics in order to clarify the relationship. The traditional view of a hierarchical ordering of ethics and economics is rejected, and it is claimed that there are substantial economic contributions to ethical justification. Weikard is in economics at the University of Bristol, U.K.

Weil, Robert, "Doomed Harvest: How PNTR and the WTO Threaten to Drive Chinese Farmers off the Land," Multinational Monitor, May 2000, pages 16-18. Much of Chinese agriculture is in small and scattered fields, not efficient by industrialized standards. But China is largely self-sufficient in grain and other foods. China's rural population has often moved to the cities, stressing agriculture, but the Chinese government has worked out means of price support, protective tariffs, and a responsibility system emphasizing local initiative. Permanent normal trade relations and entry into the WTO will undermine all

this, and U.S. and other foreign grain companies are poised to exploit the weaknesses in Chinese agriculture. Even Chinese government sources estimate that increased imports will displace ten million peasants from their land. (EE v.12,#1)

Weinstein, Tara, "Prosecuting Attacks that Destroy the Environment: Environmental Crimes or Humanitarian Atrocities?" The Georgetown International Environmental Law Review 17(no. 4, 2005):697-722. No state has ever been held accountable for environmental damage during wartime. Perhaps the time has come for change.

Weinstock, Daniel, "Full Marx," Philosophy and Geography 5 (No. 1, 2002): 115-117. Book review of David Harvey's "Spaces of Hope," Berkeley: University of California Press, 1999. (P&G)

Weir, Jack, "An Argument for the Constitutive Goodness of the Natural Environment." Southwest Philosophy Review 10 (January 1994): 167-75. The key concept of a "constitutive good" is analyzed, and the methodological moves in the argument are clarified. Human nature, including individual identities, is conditioned by the environment. Moreover, a life in a sufficiently different environment would not be a human life. Hence, the environment is a constitutive good, and ought to be preserved. (v5,#3)

Weir, Jack, "Kantian Wholism: Toward a Critical Environmental Ethic," Southwest Philosophical Studies 11(1989):1-12. Kant's ethic is rejected by most environmental ethicists, criticized as being traditionally anthropocentric. But a Kantian-type environmental ethic is possible when Kant is supplemented by insights from recent ecological science. The resulting synthesis could be labelled "Kantian wholism" or

"eco-humanism." The fundamental claim in this ethic is that it is irrationally self-destructive for rationally autonomous selves to act so as to destroy the eco-human basis of their rational self-identity. Ecological balance is necessary for both human survival and human self-identity. Normatively, based on the proposed Kantian-type wholism, our acts ought to enhance our own self-conscious rational autonomy by enhancing wholistic eco-human values. Weir teaches philosophy, Morehead State University, Morehead, KY. (v8,#3)

Weir, Jack, "Animals and Radical Translation." Southwest Philosophy Review 11 (January 1995). W. V. O. Quine's principle of charity and Richard Grandy's principle of humanity are applied to nonhuman animals. Weir argues that animals have at least some kinds of beliefs. (v5,#3)

Weir, Jack, "The Environmental Crisis as a Crisis of the Spirit," Science, Technology and Religious Ideas 5 (Fall 1994). In this paper, Weir argues that the environmental will not be solved by political science (diplomacy), natural science (technology), or philosophy (a new ideology). Rather, the problem is at its deepest level a problem of the heart--one of greed and selfishness--and will not be resolved until people's characters are transformed. (v5,#3)

Weir, Jack. "Unnecessary Pain, Nutrition, and Vegetarianism." Between the Species 7, no.1 (Winter 1991): 13-26. After an analysis of the concept and principle of unnecessary pain, meat-eating is examined in light of nutritional and socio-cultural factors. The paper concludes that vegetarianism is good but not strictly obligatory. (v8,#1)

Weir, Jack. "Response." [A Response to Steven F. Sapontzis, "Reply to Weir: Unnecessary Fear, Nutrition, and Vegetarianism," Between the Species 7, no. 1 (Winter 1991): 27-32]. Between the Species 7, no. 1 (Winter 1991): 33-35. (v8,#1)

Weir, Jack. "Poverty, Development, and Sustainability." Acorn: The Journal of the Gandhi-King Society 8, no.2 (1995): 17-22. Using ideas from Tolstoy and Gandhi, Weir argues that sustainable development is a euphemism for Westernization and Capitalistic materialism and greed. The formulation of a new, nonanthropocentric environmental philosophy will likely not solve the world's environmental problems because the problem is at bottom one of human greed and finitude (which are often called "spiritual" problems). (v8,#1)

Weiss, Rich, "Mice Made Defective to Decode Human Ills," Washington Post (6/7/98): A1. Genetically-engineered mice to have human diseases. A major new trend in biomedical research is to genetically alter mice to have biological defects that cause disease in humans. Breeds of mice, never before existing in nature, are created with inherent propensities to develop diabetes, cancer, multiple sclerosis, cystic fibrosis, arthritis, obesity, etc.. These mice serve as models that allow researchers to study disease processes and possibly to develop treatments for them. For example, mice created to possess Huntington's disease have allowed researchers to identify small protein deposits in the brain never before noticed in human patients with Huntington's. Critics charge that creating defective animals treats animals as mere tools and fosters an attitude that undermines a recent trend toward more judicious and compassionate use of lab animals. Barbara Orlans of the Kennedy Institute of Ethics at Georgetown, who supports some animal research, worries that "It's sort of carte blanche where we're going: Knock out a gene and see what happens." Mice with deformed genitals, without legs, with a single, Cyclops-like eye, and massive head deformities have all been produced. Rebecca Dresser, a bioethicist at Case Western Reserve, suggests we are creating animals "genetically programmed to suffer." Bernard Rollin, a

philosopher at Colorado State University, says "there really is something primordially horrible about replicating animals that will suffer endlessly." Another philosopher, Paul Thompson of Purdue University, says: "I can rationalize some harm to an individual animal in exchange for a valuable research result. But when we are in such a dramatic position of control that we are designing these animals from scratch, this is a different issue. ... This notion that we can own, buy, sell and exchange fundamental life processes can lead to a fundamental transformation of how we understand life as sacred." Andrew Rowan, a senior VP of the Humane Society of the U.S., along with a coalition of other groups, has recently petitioned the government to reverse its policy under which mice and rats are specifically exempted from the Animal Welfare Act, the primary federal statute that protects lab animals. Many European countries have shown greater concern about these issues. In Holland, lab animals--including mice and rats--were recently deemed to have "inherent value," a status that requires a higher level of physical and psychological care. The citizens of Switzerland are voting on a constitutional referendum that would ban the creation of--or research on--engineered animals. The referendum would also ban the release of genetically engineered microbes and plants into the environment and would limit the patenting of life forms. All of these are common practice in the U.S.. For letters to the editor about the article, including one in which Frankie Trull, President of the Foundation for Biomedical Research, asserts that "Unless one is willing to take the morally offensive view that the lives of mice are equal to the lives of people, it would be unethical not to use such a tool," see "Of Mice and Medicine," Washington Post (6/22/98): A20. (v9,#2)

Weiss, Rick, "When is Food 'Organic'? USDA Proposes 1st Rules," Washington Post (12/16/97): A1. Definition for "Organic" Food. The US Agriculture Department has put out for public comment proposed national rules that specify what types of foods can be marketed as organic. The rules require the use of environmentally-sound farming practices to maintain water and soil quality, severely limit the use of synthetic chemicals, and specify handling practices for animals. Processed foods would have to contain at least 95 percent organic ingredients to be labeled "organic." Organic meat would have to come from animals raised under "living conditions adequate to promote the health of the animal;" routine use of antibiotics and other drugs in healthy animals would be prohibited. Although a congressionally-mandated panel of experts had recommended that foods that are genetically-engineered, irradiated, or fertilized with sewage sludge be precluded, the proposed guidelines do not require this and explicitly allow the use of a genetically-engineered bacterial pesticide. The panel also had recommended that confinement of animals without space for movement or access to the outdoors be allowed only temporarily due to illness or inclement weather. The guidelines were criticized by animal-care activists for backing away from this requirement and allowing "organically-raised" animals to be confined indefinitely in crowded factory-farm conditions. The guidelines would also allow milk to be sold as organic even it came from a cow that had been on antibiotics or other drugs "relatively recently." The proposed rules could shape the \$3.5 billion organic foods industry which is growing at 20 percent a year. The stronger the rules, the more likely organic farming--currently dominated by small and medium sized farms of 100 acre or less--can continue to avoid being taken over by large agribusiness. (v.8,#4)

Weiss, Rick, "Lost in the Search for a Wolf Are Benefits in Sheep's Cloning," Washington Post (3/7/97): A3. See under: Kolata, Gina, "With Cloning of a Sheep, the Ethical Ground Shifts," New York Times (2/24/97): A1. (v8,#1)

Weiss, Rick, "Patent Sought on Making Part-Human Creatures," Washington Post (4/2/98): A12. Patents on Human-Animal Chimeras? Cellular biologist Stuart Newman and anti-biotechnology activist Jeremy Rifkin are seeking a patent on creatures that are part human and part animal (as well as a patent on a process of making such hybrids). They have not made such creatures and have no intention of doing so. Rather, their aim is to reignite debate about the morality of patenting life forms and engineering humans, activities they believe to be immoral. Patents are available on the basis of detailed descriptions of an invention, even if it is not made or used. They give owners exclusive 20-year rights to their inventions,

and Newman would use the patent to block anyone else from commercializing such processes or creatures. To date, 79 animal patents have been issued, including patents on birds, fish, and sheep.

Patents are not allowed on human beings, because the patent office has ruled that this would violate the 13th Amendment to the Constitution which bans slavery. But a number of patents have been issued for human genes and cell lines, as well as for animals that contain human genes and cells. The question these activists are forcing is: How human must something be before patents will be denied? The application is for a technique that mixes human embryo cells with embryo cells from some other animal (such as a monkey or ape) and then transfers the fused single embryo into a surrogate mother (human or other animal). The method is an updated version of one that ten years ago successfully produced "geeps," creatures that were part goat and part sheep. Because people and monkeys are more closely related to each other than sheep and goats, Newman believes the technique would work to produce human-animal chimeras of unpredictable nature. Such creatures might be useful for understanding human development, as organ donors, and for toxicity testing of human tissues.

Unlike the European patent office that can reject patents on moral grounds, the U.S. patent office is not empowered to take ethical criteria into account. The hope is that the courts and Congress will rethink the current liberal policy concerning patenting of life forms. (v9,#1)

Welchman, Jennifer, "Is ecosabotage civil disobedience?," Philosophy and Geography 4 (No. 1, 2001): 98-107. According to current definitions of civil disobedience, drawn from the work of John Rawls and Carl Cohen, eco-saboteurs are not civil disobedients because their disobedience is not a form of address and/or does not appeal to the public's sense of justice or human welfare. But this definition also excludes disobedience by a wide range of groups, from labor activists to hunt saboteurs, either because they are obstructionist or because they address moral concerns other than justice or the public weal. However earlier definitions of civil disobedience were not so narrow. I review the development of the current definition and the circumstances of its acceptance. I argue that the circumstances which help to explain the attractiveness of the Rawls/Cohen formulations in the 1970s are no longer applicable and that the question of civil disobedience should be revisited. I suggest a wider definition according to which at least some types of eco-sabotage would be civil disobedience. Welchman is Associate Professor of Philosophy at the University of Alberta. (P&G)

Welchman, Jennifer. "The Virtues of Stewardship." Environmental Ethics 21(1999):411-423. What virtues do good stewards typically have and can these virtues move people to be good stewards of nature? Why focus on the virtues of stewards rather than on trying to construct and defend morally obligatory rules to govern human behavior? I argue that benevolence and loyalty are crucial for good stewardship and these virtues can and do motivate people to act as good stewards of nature. Moreover, since it is a matter of dispute whether rational considerations can move us to perform a given act in the absence of

disposition to do so, I argue we should try to determine which moral dispositions (if any) will motivate people to be concerned for the environment so that the development of environmentally sensitive character may be encouraged. (EE)

It contains contributions to the various debates and discussions currently taking place around the world. Its goal is to enable the reader to become better aware of the complex issues facing business and better to understand what businesses need to do to contribute to sustainable development for the future.

Welker, Michael, Creation and Reality. Minneapolis: Fortress Press, 1999. 102 pages. \$ 13.00 paper. Six essays in major reconsideration of creation as a theological theme, in the light of both biological science and environmental issues, emphasizing creation as not so much unilateral act of God (the classical view) as interactive creation with creatures engaged in making themselves. "The mandate of dominion aims at nothing less than preserving creation while recognizing and giving pride of place to the interests of human beings. In all the recognizing and privileging of the interests of human beings, the central issue is the preservation of creation in its complex structures of interdependence. The expansion of the human race upon the earth is inseparable from the preservation of the community of solidarity with animals in particular, and inseparable from the caretaking preservation of the community of solidarity with all creatures in general. God judges human beings worth of this preservation of creation. They are to exercise dominion over creatures by protecting them. Human beings acquire their power and their worth precisely in the process of caretaking. The mandate of dominion according to Genesis 1 means nothing more and nothing less" (p. 73). Welker is a Reformed theologian at Heidelberg University, with considerable residency in the United States. (v.10,#2)

Wenhua, Li and Zhao Xianying, China's Nature Reserves (Beijing: Foreign Languages Press, 1989), 190 pages. Li Wenhua is one of China's foremost ecologists; Zhao Xianying is a geobotanist who has studied in the United States. Quite useful general introduction to nature reserves in China. The rationale they give: resources, aesthetics, scientific research, environmental protection, education, tourism. Humans have, in the past, had the wrong attitude toward nature, one of exploitation. "We once judged our ability to squeeze nature for all its worth as an important indication of humankind's civilization and progress. Often as not, the cost of our conquests over nature was the devastation of those elements so vital to our own existence, the earth's environment and natural resources. We were, in effect, destroying our own life-support system. Living in harmony with our planet means cherishing and protecting the natural world" (pp. 1-2). China was late forming any conservation strategy. The first reserve was in 1956, and nineteen reserves were set up by 1966, but most of these gains lost in the Cultural Revolution. Since 1976 there has been steady improvement. By late 1981 there were 76 reserves, by 1986 there were 383. A goal is 500 reserves by 2000. But one must use considerable care; many of these are paper reserves only (the designation as a reserve of the forests that remain on a former Buddhist temple site, although the area may be much used). Wenz, Peter S., Environmental Ethics Today. New York: Oxford University Press, 2000. A wide ranging introduction, featuring current facts, real controversies, individual stories, and vivid narrative, seeking to engage students and give meaning to abstract philosophical concepts. The morality of pollution permits for corporations, medical experimentation on animals, genetic engineering, economic globalization, biodiversity. Utilitarianism, contractarianism, and hermeneutic theories. The views of

Aldo Leopold, Vandana Shiva, Garrett Hardin, Peter Singer, Julian Simon, David Korten, Jane Goodall, Holmes Rolston III, J. Baird Callicott, Karen Warren, Tom Regan, Val Plumwood, Wendell Berry, Father Thomas Berry, Daniel Quinn, and Arne Naess. Wenz is in philosophy at the University of Illinois, Springfield. (v.11,#3)

Wenz, Peter S. "Pragmatism in Practice: The Efficiency of Sustainable Agriculture." Environmental Ethics 21(1999):391-410. Bryan Norton advocates using the perspectives and methods of American pragmatism in environmental philosophy. J. Baird Callicott criticizes Norton's view as unproductive anti-philosophy. I find worth and deficiencies in both sides. On the one hand, I support the pragmatic approach, illustrating its use in an argument for sustainable agriculture. On the other hand, I take issue with Norton's claim that pragmatists should confine themselves to anthropocentric arguments. Here I agree with Callicott's inclusion of nonanthropocentric consideration. However, I reject Callicott's moral monism. In sum, I support pragmatic moral pluralism that includes nonanthropocentric values. (EE)

Wenz, Peter S. "Environmental Justice through Improved Efficiency." Environmental Values 9(2000):173-188. Abstract: Environmentalists can convince others to adopt nature-friendly policies through appeal to commonly-held values. Efficiency and justice are such values in industrial societies, but these values are often considered at odds with each other and with policies that preserve land and reduce pollution. The present paper analyses the notion of efficiency and argues that transportation policies that environmentalists favour - substitution of intercity rail and urban mass transit for most automotive forms of transport - are both efficient and just. Keywords: Automobiles, efficiency, justice, mass transit, rail, transportation. Peter S. Wenz is in Philosophy at the University of Illinois at Springfield, Sch. of Liberal Arts/Sciences Brookens 482, Springfield, IL 62794-9243, USA. (EV)

Wenz, Peter S., Environmental Ethics Today. New York: Oxford University Press, 2001. Wide-ranging, front-line, readable. Part I. Anthropocentrism. 1. Overpopulation, Markets, and Human Rights (free markets, tragedy of the commons, lifeboat ethics). 2. Energy, Economics, and Future Generations (global warming, fair contracts, cost-benefit analysis). 3. Competing Human-Centered Values (environmental hazards in Third World, aesthetic values, moral pluralism, relativism).

Part II. Nonanthropocentrism. 4. Animal Liberation and Utilitarianism. 5. Animal Rights and Medical Research. 6. Species Diversity and Gaia (extinction, endangered species, mechanical and organic metaphors for nature). 7. The Land Ethic (hunting to preserve ecosystems, tigers and elephants vs. humans in the Third World).

Part III. Environmental Synergism. "Environmental synergists believe that synergy exists between respect for people and respect for nature. Overall and in the long run, simultaneous respect for people and nature improves outcomes for both. ... Respect for nature promotes respect for people, so the best way to serve people as a group is to care about nature for itself" (p. 169). (This seems to be

something like Bryan Norton's convergence hypothesis.) 8. Human Rights, Agriculture, and Biodiversity (sustainability, high-tech agriculture, fouling our own nest, anthropocentrism or synergism). 9. Ecofeminism and Environmental Justice. 10. Religion and Nature (playing God, hermeneutics, narratives, grand narratives, deep ecology, stewardship, Native American religion).

Part IV. Applications. 11. Personal Choices, Consumerism, and Human Nature. 12. Public Policies, Efficiency, and Globalization. Final Reflections: Is Optimism Justified?

In the course of the book Wenz considers the views of Thomas Berry, Wendell Berry, J. Baird Callicott, Jane Goodall, Garrett Hardin, David Korten, Aldo Leopold, Arne Naess, Val Plumwood, Daniel Quinn, Tom Regan, Holmes Rolston, III, Vandana Shiva, Julian Simon, Peter Singer, and Karen Warren. Wenz is in philosophy at the University of Illinois/ Springfield; earlier works include Nature's Keeper (1988) and Environmental Justice (1988). (EE v.12,#1)

"In this book I attempt to understand, and to suggest how to curtail, the tragedy I was taught to call progress" (frontis). Chapter titles: Our Christian Heritage. Commercialism. Industrialism. Nationalism, Bureaucracy, and the Holocaust. Nuclear Power and Radiation Exposure. Nuclear Power and Human Oppression. Indigenous Peace and Prosperity. "In societies where there is much less human oppression than in ours, nature is typically respected as valuable in itself, and people are not trying to overpower nature for human benefit" (p. 119). Indigenous World Views. Implications. Practical Suggestions for agriculture, international trade, transportation, energy, equity, population control. Living with Nature. (v9,#1)

Wenz, Peter S., Review of Andrew Light and Eric Katz, Environmental Pragmatism. Environmental Ethics 19(1997):327-330. (EE)

Wenz, Peter S. "Environmental Synergism." Some anthropocentrists, such as Bryan Norton, claim that intergenerational anthropocentrism provides the best rationale for protecting biodiversity. Some nonanthropocentrists, such as J. Baird Callicott and Eric Katz, disagree. In the present paper, I analyze different varieties of anthropocentrism, argue for adopting what is here called multicultural anthropocentrism, and then advance the following thesis of environmental synergism: combining multicultural anthropocentrism with nonanthropocentrism enables synergists to argue more cogently and effectively than either anthropocentrists or previous nonanthropocentrists for policies that both protect biodiversity and maximize long-term welfare for human beings as a group. Environmental Ethics 24(2002):389-408. (EE)

Wenz, Peter S., "Leopold's novel: The land ethic in Barbara Kingsolver's Prodigal Summer," Ethics and the Environment 8(no. 2, 2003):106-125.

Prodigal Summer corresponds to Aldo Leopold's call for "a land ethic [that] changes the role of Homo sapiens from conqueror of the land-community to plain member and citizen of it." People should "respect ... fellow-members and also ... the community as such." Barbara Kingsolver explains Leopold's key ideas and updates the Land Ethic by showing how it might guide people today. The present paper selectively displays this relationship, and then suggests some pedagogical advantages of fiction. Wenz is in philosophy, University of Illinois at Springfield. (E&E)

Wenz, Peter. "Minimal, Moderate, and Extreme Moral Pluralism." *Environmental Ethics* 15(1993):61-74. Concentrating on the views of Christopher Stone, who advocates moral pluralism, and J. Baird Callicott, who criticizes Stone's views, I argue that the debate has been confused by a conflation of three different positions, here called minimal, moderate, and extreme moral pluralism. Minimal pluralism is uncontroversial because all known moral theories are minimally pluralistic. Extreme pluralism is defective in the ways that Callicott alleges and, moreover, is inconsistent with integrity in the moral life. However, moderate pluralism of the sort that I advance in *Environmental Justice* is distinct from extreme pluralism and free of its defects. It is also consistent with Callicott's version of Aldo Leopold's land ethic, which is itself moderately pluralistic. Wenz is in the philosophy Program, Sangamon State University, Springfield, IL. (EE)

Wenz, Peter. "Philosophy Class as Commercial." *Environmental Ethics* 19(1997):205-216. Because commercialism tends toward environmental degradation, selection and treatment of the philosophical canon are environmental matters. Environmentalists and others who teach early modern and modern philosophy should, I argue, alter typical pedagogical approaches that (usually unwittingly) reinforce common assumptions underlying commercialism and promote anti-environmental perspectives. Typical treatments of Hobbes, Locke, Descartes, Kant, Hume, and Bentham focus on human selfishness, mind-body dualism, the subjectivity of values, and the mathematical nature of reality, positions that are frequently identified as contributing causes both of the environmental crisis and of commercialism. The alternative, I argue, is to place canonical thinkers in historical perspective within a history of ideas that also includes such writers as Montaigne, Erasmus, Reid, Burke, Goethe, and Emerson. Such courses can be historically accurate, pedagogically sound, and environmentally benign. Wenz is in philosophy at the University of Illinois, Springfield. (EE)

Wenz, Peter. "Ethics, Energy Policy, and Future Generations." *Environmental Ethics* 5(1983):195-209. Conflicts can arise between energy policies pursued in the interests of present people and the needs of future people for environmental and social conditions conducive to human well-being. This paper is addressed primarily to those who believe that we have moral obligations toward people of the distant future, and who consider these obligations to affect the range of energy policies which we are morally entitled to pursue. I examine utilitarian, contractarian, and formalist ethical theories to determine which provide adequate ethical bases for this moral conviction. I argue that utilitarian theories lead to bizarre prescriptions concerning energy policies that affect people of the distant future. Contractarian theories, on one interpretation, fail to support any moral concern at all for such people and, on another, exclude some relevant dimensions of moral concern, i.e., beneficence, and provide policy planners with inadequate guidance in the face of moral dilemmas. Only formalism, for example, that of W. D. Ross, supports a moral concern for people of the distant future, and yields reasonable prescriptions concerning energy policies that affect such people. Wenz is in the philosophy program, Sangamon State University, Springfield, IL. (EE)

Westing, Arthur H., "Core Values for Sustainable Development," Environmental Conservation 23(no. 3, 1996):218-225. Widely shared core social values became strikingly articulated following World War II in such documents as the Universal Declaration of Human Rights. Widely shared core environmental values began to emerge later in such documents as the World Charter for Nature and the Rio Declaration. The social values at first ignored environmental values, but the environmental values were generally couched in social terms. Key ethical issues are how to strike a balance between anthropocentric and non-anthropocentric concerns, a proper apportionment of the biosphere between humankind and other life on Earth. Stumbling blocks include the imbalance between human numbers and available natural resources, the prevalence of totalitarian and corrupt regimes, and the ineffective system of peaceful world governance. Nevertheless a trend toward environmental values is evident. Westing is with the Westing Associates in Environment, Security and Education, Putney, VT. (EE v.12,#1)

Weston, Anthony, "Listening to the Earth," Tikkun, vol. 5, no. 2, March/April 1990, pp. 50-54. A sensitive meditation on how technologically remade environments close off from us relationships with the natural world, how what we do to food and other domestic animals prevents them from being morally considerable, and how teaching environmental ethics is problematic in built environments. Anthony Weston, Department of Philosophy, State University of New York at Stony Brook, Stony Brook, NY 11794-3750. (v1,#2)

Weston, Anthony, ed., An Invitation to Environmental Philosophy. New York: Oxford University Press, 1999. \$14.95. Five original essays by prominent philosophers in environmental ethics--David Abram, Jim Cheney, Val Plumwood, Holmes Rolston III, and Anthony Weston--together with an introduction and an epilogue and resource guide by Weston. The book aims to "animate the basic questions, tell compelling stories, and offer a range of philosophical responses as complementary--not antagonistic--exploratory strategies vital to this growing topic." Intended for use as a text in upper-level environmental philosophy as well as ethics courses, alternative to the heavy academic anthologies now available, and also as a somewhat different model of environmental philosophy itself, meant for those "looking for new and more inclusive ways to approach and practice [it]". Abram's essay is "A More Than Human World"; Weston's "Is It Too Late?"; Plumwood's "Paths Beyond Human-Centeredness: Lessons from Liberation Struggles"; Rolston's "Ethics on the Home Planet"; and Cheney's "The Journey Home". Weston teaches philosophy at Elon College, North Carolina. (v.9,#3)

Weston, Anthony, "Self-Validating Reduction: Toward a Theory of Environmental Devaluation," Environmental Ethics 18(1996):115-132. Disvaluing nature—a cognitive act—usually leads quickly to devaluing it too: to real-world exploitation and destruction. Worse, in fact, nature in its devalued state can then be held up as an excuse and justification for the initial disvaluation. In this way, dismissal and destruction perpetuate themselves. I call this process 'self-validating reduction.' It is crucial to recognize the cycle of self-validating reduction, both in general and specifically as it applies to nature, if we are to have any chance of reversing it. Weston teaches philosophy at Elon College, North Carolina. (EE)

Weston, Anthony, Toward Better Problems. Philadelphia: Temple University Press, 1992. Cloth \$ 49.95. Paper \$ 18.95. Grappling with controversial issues such as abortion, animal rights, and environmental ethics, Weston explores the significance of approach and perspective in any decision-making context. The seemingly endless debates can be simplified or avoided by a "preventive ethics" that acknowledges

that all values bearing on a social problem are acknowledged as equal and "correct." Chapter 4 is on animals, Chapter 5 on the environment. Weston is professor of philosophy at SUNY, Stonybrook. This year he is at Elon College, Elon, NC. ISEE members can obtain a 20% discount by identifying themselves. 800/447-1657. (v3,#3)

Weston, Anthony. "Forms of Gaian Ethics." Environmental Ethics 9(1987):217-30. James Lovelock's "Gaia hypothesis"--the suggestion that life on Earth functions in essential ways as one organism, as a single living entity--is extraordinarily suggestive for environmental philosophy. What exactly it suggests, however, is not yet so clear. Although many of Lovelock's own ethical conclusions are rather distressing for environmental ethics, there are other possible approaches to the Gaia Hypothesis. Ethical philosophers might take Gaia to be analogous to a "person" and thus to have the same sorts of values that more familiar sorts of persons have. Deep ecologists might find in the Gaia hypothesis a means by which to transform and reunderstand our concrete experience of the world. This essay canvasses some of the strengths, weaknesses, and possibilities of each approach. Weston is in the philosophy department, State University of New York, Stony Brook, NY.

Weston, Anthony. Review of *Beneath the Surface: Critical Essays in the Philosophy of Deep Ecology*. Edited by Eric Katz, Andrew Light, and David Rothenberg. Environmental Ethics 23(2001):331-334. (EE)

Weston, Anthony. "Multicentrism: A Manifesto." Environmental Ethics 26(2004):25-40. The familiar "centrisms" in environmental ethics aim to make ethics progressively more inclusive by expanding a single circle of moral consideration I propose a radically different kind of geometry. Multicentrism envisions a world of irreducibly diverse and multiple centers of being and value not one single circle, of whatever size or growth rate, but many circles, partly overlapping, each with its own center. Moral consideration necessarily becomes plural and ongoing, and moral action takes place within an open-ended context of negotiation and covenant. Much critical and constructive work, both in environmental ethics proper and in many related fields, is already multicentric in spirit. It needs to be drawn together into an explicit, alternative environmental-ethical "platform." (EE)

Weston, Anthony. "Unfair to Swamps: A Reply to Katz." Environmental Ethics 10(1988):285-88.

Weston, Anthony. "Before Environmental Ethics." Environmental Ethics 14(1992):321-38. Contemporary nonanthropocentric environmental ethics is profoundly shaped by the very anthropocentrism that it tries to transcend. New values only slowly struggle free of old contexts. Recognizing this struggle, however, opens a space for--indeed, necessitates--alternative models for contemporary environmental ethics. Rather than trying to unify or fine-tune our theories, we require more pluralistic and exploratory methods. We cannot reach theoretical finality; we can only co-evolve an ethic with transformed practices. Weston is in the philosophy department, State University of New York, Stony Brook, NY. (EE)

Weston, Anthony. "Beyond Intrinsic Value: Pragmatism in Environmental Ethics." Environmental Ethics 7(1985):321-39. I propose an environmental ethic in the pragmatic vein. I begin by suggesting that the contemporary debate in environmental ethics is forced into a familiar but highly restrictive set of distinctions and problems by the traditional notion of intrinsic value, particularly by its demands that intrinsic values be self-sufficient, abstract, and justified in special ways. I criticize this notion and develop an alternative which stresses the interdependent structure of values, a structure which at once roots them deeply in our selves and at the same time opens them to critical challenge and change. Finally,

I apply this alternative view back to environmental ethics. It becomes easy to justify respect for other life forms and concern for the natural environment, and indeed many of the standard arguments only become stronger, once the demand to establish intrinsic values is removed. Weston is in the philosophy department, State University of New York, Stony Brook, NY. (EE)

Weston, Anthony. "Universal Consideration as an Ordinary Practice." Environmental Ethics 20(1998):279-89. Tom Birch has decisively transformed the so-called "considerability" question by arguing that all things must be "considerable" from the start in "the root-sense" if we are to determine what further kinds of value they may have. Spelling out this kind of "root" or "deep" consideration proves to be difficult, however, especially in light of post-Kantian conceptions of mind. Such consideration may also ask of the world too ready a kind of self-revelation. This paper proposes another, complementary version of universal consideration: as a kind of practical invitation, as a way of creating the space within which a response can emerge or an exchange coevolve. I conclude by locating this vision within a picture of ethics as a whole that brings what I call its "ordinary" stage, rather than its formal stage, into focus. Weston is in philosophy, Elon College, NC. (EE)

Weston, Anthony. A Practical Companion to Ethics. New York: Oxford University Press, 1997. The closing section of this small book is "The Expanding Circle," ethics extended to animals, to the enormous creativity, complexity, and depth of the rest of the world, the nonhuman, the other-than-human, the more-than-human" (p. 80). Westra, L.S., Bowen, K.L., and Behe, B.K., "Agricultural Practices, Ecology, and Ethics in the Third World", Journal of Agricultural and Environmental Ethics 4(1991):60-77. The increasing demand for horticultural products for nutritional and economic purposes by lesser developed countries (LDC's) is well-documented. Technological demands of the LDC's producing horticultural products is also increasing. Pesticide use is an integral component of most agricultural production, yet chemicals are often supplied without supplemental information vital for their safe and efficient implementation. Illiteracy rates in developing countries are high, making pesticide education even more challenging. For women, who perform a significant share of agricultural tasks, illiteracy rates are even higher than for men. The dilemma exists of how a developing country can improve its nutritional and economic situation without giving consideration to social and environmental consequences.

Westra, Laura, and Robinson, Tom, eds. The Greeks and the Environment. Lanham, MD: Rowan and Littlefield Publishers, 1997. 184 pp. \$21.95 paper, \$52.50 cloth. A collection of original essays that reexamines the views of nature and ecology found in the thought of Plato, Aristotle, the Stoics, and Plotinus. Recognizing that these thinkers were not confronted with the environmental degradation that threatens contemporary philosophers, the contributors find that the Greeks nevertheless provide an excellent foundation for a sound theory of environmentalism. Westra is in philosophy at the University of Windsor. Robinson is in philosophy at the University of Toronto. (v8,#1)

Westra, Laura, "'Respect,' 'Dignity,' and 'Integrity': An Environmental Proposal for Ethics," Epistemologia 12(1989):91-124. Westra proposes an account that has a wider reach than either Albert Schweitzer's reverence for life or Paul Taylor's respect for nature. (v1,#2)

Westra, Laura, An Environmental Proposal for Ethics: The Principle of Integrity. Lanham, MD: Rowman and Littlefield, 1993. 240 pages. \$ 21.95 paper. \$ 55.00 cloth. What does ecosystem integrity mean as a basis of moral obligation? Part I: The Theory of Integrity, with chapters analyzing integrity, respect, and dignity in philosophy, science, and law, and concluding with a defense of biocentric holism. Part II. The Practice of Integrity, with analysis how to make the concept of ecosystem integrity operational. "Westra's book is the best philosophical defense, to date, of the ecosystems approach to environmental ethics" -- Kristin Shrader-Frechette. "This original discussion breaks new ground by thoroughly analyzing ethical values, centering on the concept of ecological integrity, that apply intrinsically to nature and that govern our rightful use of the environment" -- Mark Sagoff. Westra is in philosophy at the University of Windsor. (v4,#3)

Westra, Laura, "Biotechnology and Transgenics in Agriculture and Aquaculture: the Perspective from Ecosystem Integrity," Environmental Values 7(1998):79-96. New agricultural technologies are often justified morally in terms of their expected benefits, e.g., feeding the world's hungry. Such justifications stand or fall, not only on whether such benefits are indeed forthcoming, but on whether or not they are outweighed by attendant dangers. The practical details of each case are, therefore, all-important. In this paper agriculture and aquaculture are examined from the perspective of ecosystem integrity, and with further reference to the uncertain effects of anthropogenic changes in the earth's atmosphere. The principle of integrity provides a strong justification for a cautious approach to new technologies, and particularly so in the case of transgenics. KEYWORDS: Agriculture, aquaculture, biotechnology, ecosystem health, integrity. Laura Westra is at University of Windsor, Ontario. (EV)

Westra, Laura, "The Ethics of Environmental Holism and the Democratic State: Are they in Conflict?" Environmental Values Vol.2 No.2(1993):125-136. ABSTRACT: Environmental holism, with its demands for universality, appears to undermine the democratic rights of individuals, and of nation states within the international community. But these rights may better be viewed as means towards justice or other goods, rather than as ends in themselves. Where basic survival issues are involved, environmental 'triage' may be morally essential, and some checks on 'populist' democratic politics inevitable. KEYWORDS: Democracy, environmental ethics, holism, individual rights. University of Windsor, 401 Sunset, Windsor, Ontario, Canada N9B 3P4.

Bullard, Clarice Gaylord, Hussein Adam, Bill Lawson, Robert Goodland, Howard McCurdy, Kristin Shrader-Frechette, Omari Kokole, Peter Wenz, and Laura Westra. Although most minorities are bearing disproportionate burdens such as toxic waste exposure and other environmental hazards. This volume deals exclusively with persons and communities of color who are either African or African American. Holistic approaches to environmental protection are generally accepted as necessary to preserve the ecosystem and avoid mass extinctions that jeopardize human existence. However, such approaches may be viewed as risking some individuals or groups for the good of the whole. Racial minorities in the U.S. are disproportionately exposed to toxic wastes and other environmental hazards. Internationally, wealthy countries of the North increasingly ship hazardous wastes to poorer countries of the South. Ecocentric environmentalists are often viewed by the general public as unconcerned about human hazards: "If it doesn't swim upstream or hoot in the night, environmentalists don't care about it." (Withlynn Battle, Community leader, Birmingham, AL). These essays show that environmentalism and concern for human beings and justice are entirely compatible. Convention on the Rights of the Child, industrial disasters, toxic spills, clean water provision, diet, HIV/AIDS, environmental racism and climate change, the Kyoto Protocol, the Millennium Development Goals, and international trade. Case studies such as Bhopal and Chernobyl. Westra is philosophy (emeritus), University of Windsor, and adjunct professor in social science, York University, Toronto.

Westra, Laura, and Lemons, John, eds. Perspectives on Ecological Integrity. Boston, London, Dordrecht: Kluwer Academic Publishers, 1995. 279pp. Recently, concepts of ecological integrity have been proposed to facilitate enhanced protection of biological and ecological resources against the threat of human activities. The promotion of ecological integrity as a basis for public policy and decision making stems from scientists and others concerned about the threats of human activities to ecosystems and species, and from philosophers attempting to derive a more suitable ethic to guide the relationships between humans and the nonhuman environment. Although ecological integrity has been proposed as a norm for public policy and decision making, the concept is relatively new and therefore the underlying scientific and philosophical rationales have not been developed fully. This book offers a number of perspectives that are intended to stimulate and inform future discussion concerning the importance and consequences of ecological integrity for science, morality, and public policy. The audience of this work

will include environmental professionals, whether academic, governmental, or industrial, or in the private consultancy sector. It is also suitable as an upper level reference text. Westra, Laura. Living with Integrity: A Global Ethic to Restore a Fragmented Earth. Lanham, MD: Rowan Littlefield, 1997. This innovative book takes a new look at environmental ethics and the need for ecological and biological integrity. Westra explores the necessity for radical alteration not only of interpersonal ethics but also of social institutions and public policy. In the process, Westra denies the validity of majority rule in environmental ethical concerns. Issues discussed in the book include the link between ecological integrity and human health; an environmental evaluation of business and technology; biotechnology and transgenics in agriculture and aquaculture; and the environmental ethics of the ancient Greeks and Kant. (v8,#3)

Westra, Laura. "Let It Be: Heidegger and Future Generations." Environmental Ethics 7(1985):341-50. The concept of freedom in Heidegger's sense of truth or unconcealedness of beings may be applied to future generations without thereby reducing the status of other elements within the environment to mere means, since Da-sein's approach as one who is a caring and concerned, anxious and aware of its own death in an authentic manner, does not place man in any sense "above" other things. This care (Sorge), concern, favor, can be captured in Heidegger's remark that man is not the lord of beings, but rather is "the Shepherd of Being." Accordingly, we may be able to learn to moderate our ordering and commanding attitude and learn to "listen" and free beings, letting them be what they truly are. If so, we might then require no special justification in order to extend toward earth, sky, and future persons the same understanding and freeing concern we normally give to, and wish for, ourselves. Westra is in the department of history, philosophy, and religion, Clemson University, Clemson, SC. (EE)

Westra, Laura. "Ecosystem Integrity, Sustainability, and the 'Fish Wars.'" Wild Earth, Summer 1996, pp. 66-69. The cod population in Newfoundland waters crashed in 1992, a result of overfishing for decades. In 1995, haddock (turbot) populations declined, due to overfishing beyond the 200 mile limit in the Grand Banks off the coast of Newfoundland, resulting in dispute to the point of violence between Canadians and Spanish fishing crews. Westra argues that such problems can be best addressed through an ethics of ecosystem integrity, from which strict regulations and reduced quotas follow. Westra is in philosophy at the University of Windsor, Ontario. (v7, #3)

Westra, Laura. "Why Norton's Approach is Insufficient for Environmental Ethics." Environmental Ethics 19(1997):279-297. There has been an ongoing debate about the best approach in environmental ethics. Bryan Norton believes that "weak anthropocentrism" will yield the best results for public policy, and that

it is the most defensible position. In contrast, I have argued that an ecocentric, holistic position is required to deal with the urgent environmental problems that face us, and that position is complemented by the ecosystem approach and complex systems theory. I have called this approach "the ethics of integrity," and in this paper I show why this perspective suggests better solutions to difficult cases, for which "weak anthropocentrism" fails to provide an answer. Westra is in philosophy at the University of Windsor, Windsor, Canada. (EE)

Westra, Laura. "Environmental Integrity, Racism, and Health." The Science of the Total Environment 184 (1996): 57-66. Environmental degradation seriously affects human health. Thus, a close relationship exists between the protection of ecosystem integrity and wilderness on one hand, and human health on the other. However, there is an overarching holistic perspective in laws and regulations--as well as morality--to maintain a healthy relationship between the two. Problem areas focused on in this paper are: (a) climate change and global warming; (b) food production; and (c) global equity. Westra is in philosophy at the University of Windsor, Ontario. (v7, #3)

Westra, Laura. Review of Etica e Ambiente. By Sergio Bartolommei. Environmental Ethics 13(1991):367-69.

Westra, Laura. "From Aldo Leopold to the Wildlands Project: The Ethics of Integrity." Environmental Ethics 23(2001):261-274. Aldo Leopold's influence on environmental ethics cannot be overstated. I return to Leopold's work in order to show the connection between the ethics of integrity and many of the points made by Leopold in his writings. I also show how the spirit of Leopold's land ethic and his love and respect for wilderness is present and current in the Wildlands Project, and that it is a live part of public policy in North America, albeit a debated one. (EE)

Westra, Laura. "Ecosystem Integrity and the 'Fish Wars.'" Journal of Aquatic Ecosystem Health 5(1996):275-282. The problem of fisheries and aquatic ecosystems in Canada have been analyzed primarily from the standpoint of the conservation of these resources, without much emphasis on the value of aquatic ecosystems for themselves, including their life-support function, vital to all the biota therein. This represents a purely anthropocentric approach, that is flawed from the standpoint of sustainability practically and theoretically. Without entering into the anthropocentrism debate, this study indicates the apparent conflict between theoretical legislative and regulative aims, and most forms of "management principles," even when these are presented in their most enlightened forms. Starting with the examination of a recent Canadian case, the failure of present management practices is outlined, even when these are democratically chosen and support worthwhile social goals. The Canadian "fish wars" example shows clearly why the ethics of integrity provide better guidelines for public policy, as such ethics alone take as primary biological and ecological objectives. Westra teaches philosophy at the University of Windsor, Ontario. (v8,#2)

Westra, Laura. "Ecology and Animals: Is There a Joint Ethic of Respect?" Environmental Ethics 11(1989):215-30. Recent work in animal ethics has advanced principles that are too individualistic to be compatible with a holistic environmental ethic such as the land ethic proposed by Aldo Leopold. J. Baird Callicott, on the other hand, has attempted to reconcile the two ethics by suggesting that sympathy, natural among humanity, as he claims on Humean grounds, does not necessarily terminate at the species barrier. His argument shows minimally that it is not necessary that we abandon ecological ethics in order to view nonhuman animals as morally considerable. I argue instead that it is not sympathy, but hostility/indifference that manifests the reality of life in wild nature, and as such forms a better basis for an all-encompassing ethic. If one accepts that the factual realm suggests the limits of norms and establishes the background and context of normative judgments in this context (as Holmes Rolston, III, for instance, does), then a different line of argument can be developed. I argue that intraspecies and interspecies ethics ought to be different for us because behavior in the wild is different within and without a species.

Further, I argue that hostility/indifference coupled with respect form the basis of an approach which embraces a holistic environmental ethic as well as one concerned with nonhuman animals. Westra is in the philosophy department, Auburn University, Auburn, AL. (EE)

Westra, Laura. Ecoviolence and the Law: Supranational Normative Foundations of Ecocrime. 2004. ISBN 1-57105-316-6. 480 pages. Westra proposes a different way of looking at the multiple environmental crises threatening the global community, contending that the current movement in both ethics and the law to separate human rights from environmental rights is profoundly misguided. These, she argues, are not separate fields of study or endeavor, rather, they are closely interrelated principles. Access to clean air and water, land capable of growing uncontaminated food, and a climate that fosters growth are inherent human rights. Part I provides a theoretical framework within which to analyze her main concern, and on which to rest the defense of the primary argument of this work: simply, environmental harms are assaultive in nature; hence they are not "quasi-crimes" but actual crimes—ecocrimes. Part II deals with practical concerns and examines cases where the deprivation of environmental rights can be construed as an assault on the current and future well-being of a community. Part III analyzes international covenants that recognize and emphasize the gravest crimes against humanity. The final chapter covers obstacles that have emerged in the defense of basic human rights. The author concludes with a proposal for the creation of an International Environmental Court that would adjudicate ecocrime issues. This forward-thinking work provides careful analysis with imaginative solutions. To order contact Transnational Publishers. Phone: 914-693-5100. Toll free: 800-914-8186. Westra, Laura. "The Disvalue of 'Contingent Valuation' and the Problem of the 'Expectation Gap'." Environmental Values 9(2000):153-171. Abstract: 'Contingent Valuation' is a method often used to make decisions about environmental issues. It is used to elicit citizens' preferences at the location of a specific facility, new road and the like. I argue that even if we could elicit a truly informed and 'free' choice, the method would remain flawed, as 1) all 'local' activity also has far-reaching environmental consequences; 2) majority decisions may support choices that adversely affect minorities; 3) even with full information, consenting to harms like significant alterations of our normal functioning or health, or genetic mutations, may not be morally acceptable. Keywords: Risk assessment methods, citizens' choices, global impacts, minority rights. Laura Westra is at Sarah Lawrence College, 1 Mead Way, Bronxville, New York 10708-5999, USA. (EV)

Westra, Laura. *Environmental Justice and the Rights of Indigenous Peoples: International and Domestic Legal Perspectives*. London: Earthscan Publications, 2007. Westra reconstructs the historical background and current legal plight of indigenous peoples by using examples from case law and showing how indigenous peoples' lack of sufficient legal rights consistently leaves them defenseless against environmental injustices.

Wetlesen, Jon, "Hvorfor naturvern? Noen kommentarer til Arne Naess' dypokologiske svar (Why protect nature? Some comments on Arne Naess' deep ecological answer)," Norsk filosofisk tidsskrift 27(no. 3, 1992):87-110. The deep ecology platform treats as synonyms value in itself, intrinsic value and inherent value. But these are not synonyms and the deep ecological claim about value in nature is ambiguous. Intrinsic value can be interpreted teleologically. Inherent value can be interpreted deontologically. If clarified and both meanings are used, this can be used to advantage in what deep ecology hopes to achieve. But Naess is biased toward the teleological emphasis. (Norway)

Wetlesen, Jon, "Animal Rights or Human Duties?" Archiv für Rechts- und Sozialphilosophie, Beiheft, 1994. In English. Wetlesen develops the notion of inherent value within a deontological framework.

The argument is related to that of Tom Regan and Paul Taylor, extending the notion of inherent value analogically, first from moral agents to moral persons who are not agents; and then to moral subjects who are not moral persons. The argument proceeds casuistically, based on morally relevant similarities and differences, these being fundamentally the capability of conation or autopoiesis, a capacity of self-organization, self-reproduction, and self-determination. This will include all individual living organisms within the class of moral subjects, and, with some uncertainty, perhaps supra-individual wholes as well. Unlike Regan and Taylor, Wetlesen ascribes inherent value in a gradual manner, depending on the degree of similarity with a moral agent who has the capacity for rational self-determination. The stringency of moral duties binding other agents is proportional to the degree of inherent value. Wetlesen is on the philosophy faculty at Oslo and teaches environmental ethics there. A copy is available on request. Address: Department of Philosophy, University of Oslo. E-mail: jon.wetlesen@filosofi.uio.no

Wetlesen, Jon. "The Moral Status of Beings Who are not Persons: A Casuistic Argument." Environmental Values 8(1999):287-323. ABSTRACT: This paper addresses the question: Who or what can have a moral status in the sense that we have direct moral duties to them? It argues for a biocentric answer which ascribes inherent moral status value to all individual living organisms. This position must be defended against an anthropocentric position. The argument from marginal cases propounded by Tom Regan and Peter Singer for this purpose is criticised as defective, and a different argument is proposed. The biocentric position developed here is related to that of Albert Schweitzer and Paul F. Taylor, but rejects their assumption of equal inherent value for all living organisms. It argues instead for equal moral status value for moral persons and agents, and gradual moral status value for nonpersons, depending on their degree of similarity with moral persons. Mary Ann Warren's recent book on Moral Status is also discussed. The argument is constructed as a casuistic argument, proceeding by analogical extension from persons to non-persons. The meta-ethical question of its pragmatic validity is discussed. KEYWORDS: moral status, inherent value, casuistic argument, strong versus weak cognitivism, pragmatic validity. Wheale, Peter, ed. The Social Management of Biotechnology: Workshop Proceedings. Tilburg, The Netherlands: International Centre for Human and Public Affairs, 1996. Dfl 29,- (Dutch guilders). This volume of collected papers is designed to inform, stimulate and engage all those interested in the emerging biotechnological age. Topics covered in the text include the ethical questions raised by the creation of transgenic farm animals, the morality of genetic experimentation on animals, the controversy surrounding the patenting of genetic material and of the transgenic animals themselves, and the ethical implications of engineering transgenic animals for the sole purpose of transplanting their organs into humans (xenografting). Also considered are the environmental hazards, public policy issues, and the political implications of modern biotechnology and genetic engineering.

Wheelwright, Jeff. Degrees of Disaster: Prince William Sound--How Nature Reels and Rebounds. New Haven: Yale University Press, 1996. 352 pages. \$16 paper. The ecological effects of the 1989 Exxon Valdez oil spill on Prince William Sound. The complex story of a region where natural disturbance is normal. While the spill had toxic short-term effects, the author concludes that cleanup efforts probably perpetrated more damage than the oil did. Left alone, the Sound would have repaired itself quickly. Throughout the book the author illuminates the gap between the scientists's measurements of change and the public's understanding of disaster. (v7, # 3)

Wheelwright, Nathaniel T., "Enduring Reasons to Preserve Threatened Species," The Chronicle of Higher Education, June 1, 1994, B2,B3. Many endangered species may not be good for anything, either in the markets of economics or for their roles in ecosystems. "It is poor conservation strategy to bank on the arguments of economics or ecologists alone. Why? Because the most convincing case for rain forests is simply that the loss of species, like the destruction of a Beethoven symphony or a Renoir painting of the Taj Mahal, would be a loss of splendence. ... Religious leaders and philosophers have the training to raise the moral and philosophical values of preserving species. Traditionally they have had the courage to explore life's most difficult issues. Yet thus far their voices have hardly been heard in the debate over biodiversity. They can and must speak up, defining and explaining the sanctity not just of human life but of life in all of its forms." Wheelwright is a biologist at Bowdoin College who has studied resplendent quetzals in Costa Rica. (v7,#1)

White, Amy. "Environmental Harms, Causation, and Act Utilitarianism." Environmental Ethics 26(2004):189-203. It is in group environmental harms. Such attempts are seriously flawed. Causation need not, and many times should not, be important in assessments of accountability for act utilitarians. A model that maximizes utility in such assessments called the "best fit model" provides a good alternative. Because use of this model leads to more utility than models of after-the-fact accountability which rely on causal links, act utilitarians should adhere to the "best fit model" regardless of actual causal links. Although the "best fit model" is a better method to assign accountability using an act utilitarian approach than methods involving causation, it does have a serious flaw in regard to application and future utility. Given this flaw, the model (indeed, any after-the-fact model of accountability) is not enough to ensure future utility maximization. To maximize utility to the fullest, the model should be used along with incentives to prevent environmental harm before it occurs. Perhaps if such incentives are strong enough, the model may not need to be imposed at all. However, in cases where harm does occur, the "best fit model" yields the most utility. Thus, if the "best fit model" is not an acceptable method by which to assess responsibility, neither is act utilitarianism. (EE)

White, Damien Finbar. "Hierarchy, Domination, Nature: Considering Bookchin's Critical Social Theory", Organization and Environment, 16, (No. 1, 2003): 34-65. The work of Murray Bookchin stands as one of the most ambitious attempts in recent times to produce a post-Marxist critical social theory that places

ecological concerns at its core, and this article argues that this richly elaborated theory has highlighted the distinct limitations of "high modernist" formulations of historical materialism and liberalism. However, it is also maintained that Bookchin's "organic society" thesis and his theorising about social hierarchy, social domination, and the domination of nature ultimately suffer from significant theoretical and empirical inconsistencies. Bringing Bookchin's more valuable insights into dialogue with the recent interface between "historical-geographical materialism" and poststructuralism, a dynamic, discontinuous view of eco-social relations is recommended that recognises that human societies are always involved in the production, reproduction and enframing of disruptive, active and generative natures. How forms of social domination relate to these processes is viewed as complex, contingent, and spatially and historically varied. White is a lecturer in sociology at Goldsmiths College, University of London.

White, Rodney R., North, South, and the Environmental Crisis. Toronto: University of Toronto Press, 1993. 256 pages. Cloth, Canadian \$ 50. Paper \$ 17.95. What used to be viewed as local environmental problems are really linked to the whole process of global industrialization, urbanization, and rapid population growth. In the extension of European power over most of the globe, the environment was considered as external to economic rationality. In developing countries population is producing megacities that are creating an alarming imbalance between population and resources at the same time that they are becoming major industrial producers and major polluters. A serious problem is the lack of shared technologies. Unless the richer nations share their technologies, and unless they support trade policies that will allow poor nations to export their goods and to generate wealth for environmental conservation, the implications are ominous for all of us. Whiteside, Kerry H., "Worldliness and Respect for Nature: an Ecological Application of Hannah Arendt's Conception of Culture," Environmental Values 7(1998):25-40. Arendt's conception of culture could supersede claims that nature's intrinsic value or human interests best ground environmental ethics. Fusing ancient Greek notions of non-instrumental value and Roman concerns for cultivating and preserving

worldly surroundings, culture supplies an ethic for the treatment of nonhuman things. Unlike a system of philosophical propositions, an Arendtian ecology could only arise in public deliberation, since culture's qualitative judgements are intrinsically linked to processes of political persuasion. KEYWORDS: Arendt, ecology, culture, politics, judgement (judgment). Whiteside is at Franklin and Marshall College, PA. (EV)

Whiteside, Kerry H. "Hannah Arendt and Ecological Politics." Environmental Ethics 16(1994):339-358. I argue that Arendt's understanding of "society" deepens Green critiques of productivism. By avoiding subjectivist or objectivist modes of thought, Arendt uncovers hidden links between life-sustaining labor and a world-destroying drive to consume. Checking environmentally destructive desires to produce and consume requires structuring communities around an optimal configuration of public deliberation, work and labor. I conclude that an Arendt-inspired ecological politics stresses the interdependence of human values and an all-encompassing natural order. Whiteside is with the Dept. of Government, Franklin and Marshall College, Lancaster, Pa. (EE)

Whiteside, Kerry H., Divided Natures: French Contributions to Political Ecology. Cambridge, MA: MIT Press, 2002 (coming in May) Much of environmental theory in English is shaped by the anthropocentrism/non-anthropocentrism debate. This debate is almost nonexistent among French theorists, who focus on the processes linking nature and human identity. The insights of French theorists could help English language theorists extricate themselves from endless debates over the center of nature's value. Among the French theorists discussed are Denis de Rougemont, Denis Ducios, René Dumont, Luc Ferry, André Gorz, Félix Guatarri, Bruno Latour, Alain Lipietz, Edgar Morin, Serge Moscovici, and Michael Serres. The English-language theorists discussed include John Barry, Robyn Eckersley, Robert Goodin, Tim Hayward, Holmes Rolston III, and Paul Taylor. (v.13, #3)

Whiteside, Kerry H., Review of: Bess, Michael, The Light-Green Society: Ecology and Technological Modernity in France, 1960-2000. Chicago: University of Chicago Press, 2003. Environmental Values 14(2005):138-140.

Whiteside, Kerry. *Precautionary Politics: Principle and Practice in Confronting Environmental Risk*. Cambridge, MA: The MIT Press, 2006. The precautionary principle - which holds that action to address threats of serious or irreversible environmental harm should be taken even in the absence of scientific certainty - has been accepted as a key feature of environmental law throughout the European Union. In the U.S., however, it is still widely unknown, and much of what has been written on the topic takes a negative view. Whiteside provides an analysis of the precautionary principle - its origins and development, its meaning and rationale, its theoretical context, and its policy implications. He looks at the application of the principle (and the controversies it has stirred) and compares European and American attitudes toward it and toward environmental regulation in general.

Whitney, Elspeth. "Lynn White, Ecotheology, and History." Environmental Ethics 15(1993):151-69. Controversy about Lynn White's thesis that medieval Christianity is to blame for our current environmental crisis has done little to challenge the basic structure of White's argument and has taken little account of recent work done by medieval scholars. White's ecotheological critics, in particular, have often failed to come to grips with White's position. I question White's reading of history on both interpretative and factual grounds and argue that religious values cannot be treated independently of the political, economic, and social conditions that sustain them. I conclude that medieval religious values were more complex than White suggests: rather than causing technological innovation, they more likely provided a justification for other activity taking place for other reasons. Whitney is in the department of history, University of Nevada, Las Vegas, NV. (EE)

Whitney, G, "Robert A. Lambert, Contested Mountains: Nature, Development and Environment in the Cairngorms Region of Scotland, 1880-1980," Environmental History 7(no.4, 2002): 683-684.

Whittbecker, Alan E. "Metaphysical Implications from Physics and Ecology." Environmental Ethics 12(1990):275-82. I contrast metaphysical implications from physics and ecology and compare them through two concepts, the field, primary in physics and borrowed by ecology, and wholeness, postulated in ecology and borrowed by physics. I argue that several implications from physics are unacceptably reductive or erroneous and identify an old and a new ecology. Metaphysical implications from the old ecology are quite different from the new ecology, as well as from quantum or Newtonian physics. Wittbecker is at the Marsh Institute, Viola, ID. (EE)

Whittemore, Colin T. "Response to the Environmental and Welfare Imperatives by U.K. Livestock and Production Industries and Research Services." Journal of Agricultural and Environmental Ethics 8(1995):65-84. Production methods for food from U.K. livestock industries (milk, dairy products, meat, eggs, fibre) are undergoing substantial change as a result of the need to respond to environmental and animal welfare awareness of purchasing customers, and to espouse the principles of environmental protection. There appears to be a strong will on the part of livestock farmers to satisfy the environmental imperative, led by the need to maintain market share and by existing and impending legislation. There has been support forthcoming in the form of Government-sponsored scientific research and technological development to provide the necessary framework for new environmentally sensitive practices. The agricultural community has itself made substantial responses to market demand through the inception of Farm Assured Quality Assurance Schemes. These appear to have a more sustainable future than the extremes of organic farming and free-range practices. Pollution of agricultural land with nitrate and phosphate by intensive livestock industries is a greater problem in some parts of continental Europe than it is in the U.K. The distribution of livestock out of intensive units and into mixed farming systems, would require substantial restructuring of the industry. Many of the animal welfare requirements which have been forwarded as a part of the environmental agenda for agriculture have been voluntarily accepted by livestock producers. However, some major aspects, such as alternative housing systems for pigs and poultry, remain unresolved. Analysis of the science and technology support for the environmental imperative, especially from Government sources, would suggest that, although dramatically increased in recent years, environmentally orientated research remains a relatively small proportion of the whole. Whilst a movement away from governmental funding of volume production appears to be justifiable, there has not been an equivalent balancing of effort toward funding for product quality, sustainability, environmental protection and animal welfare. Nevertheless, the university education system is producing a generation of more environmentally aware agricultural science graduates who are opting to pursue Government-sponsored environmentally orientated postgraduate research programs. (JAEE)

Whitten, Andrew, "The Second Inheritance System of Chimpanzees and Humans," Nature 437(1 Sept. 2005):52-55. "When we focus our comparative lens on culture, the evidence is all around us that a gulf separates humans from all other animals. Nevertheless, recent studies of great apes suggest that they resemble us culturally to an extent unmatched by other species" (p. 52) Some prefer to use "traditions" for behavior that animals acquire by imitation, present in many vertebrate species, such as birds, maybe even in invertebrates. But chimp groups can have an array of multiple and specific traditions that can be called "culture."

"Ape culture may be particularly complex among non-human animals, yet it clearly falls short of human culture. An influential contemporary view is that the key difference lies in the human capacity for cumulative culture, whereby the achievements of successive generations have built on previous developments to create complex structure such as languages and technologies. Chimpanzees have

accumulated many traditions, but each remains sufficiently simple that there is little scope for it to have developed significant complexity compared to its original form. Hints of cumulation exist, such as the refinement of using prop stones to stabilize stone anvils during nut cracking, but these remain primitive and fleeting by human standards" (p. 53). Whitten is in psychology, University of St. Andrews, Scotland.

Whitten, Tony, Derek Holmes, and Kathy Mackinnon, "Conservation Biology: A Displacement Behavior for Academia?," Conservation Biology (no.1, Feb. 2001): 1-. Academic conservation biology and biologists were quite ineffective in the dramatic deforestation of Sumatra, an all too typical case. "Perhaps conservation biology is merely a displacement activity for concerned biologists within the academic system. Deep inside they would really love to attack the alpha male of conglomerate-led forest destruction, but a lack of access and funds, and the political and social complexities of conservation management, means they huddle together, metaphorically scratching their backsides and snorting" (p. 3). Wickins-Drazilova, Dita, "Zoo Animal Welfare," Journal of Agricultural and Environmental Ethics 19(2006):27-36. The continuing existence of zoos and their good purposes, such as conservation, science, education, and recreation, can be ethically justified only if zoos guarantee the welfare of their animals. The usual criteria for measuring animal welfare in zoos are physical health, long life, and reproduction. This paper looks at these criteria and finds them insufficient. Additional criteria are submitted to expand the range of welfare considerations: natural and abnormal behavior; freedom and choice; and dignity. All these criteria should play a role in analyzing zoo animal welfare and interests but dignity has the overriding part because it impacts on both animal and human interests. Keywords: animal - dignity - ethics - reintroduction - welfare - zoos. Wickins-Drazilova is at the Department of Environmental Studies, School of Social Studies, Masaryk University Brno, Czech Republic. (JAEE)

Wiens, John A., "Toward a Unified Landscape Ecology." Pages 148-151 (the conclusion) in Wiens, John A., and Moss, Michael R., eds., Issues in Landscape Ecology. Guelph, Ont.: The International Association for Landscape Ecology, 1999. A sourcebook for the International Association for Landscape Ecology Fifth World Congress, Snowmass Village, CO, 1999. Landscapes and culture are inseparable in two ways. The first is that culture affects the way humans can perceive landscapes; there is a "challenge of overcoming our culturally conditioned perceptions of landscapes to deal with landscapes at other scales."

"The second way that the culture-landscape linkage affects landscape ecology has to do with ethics. There is in most human cultures a deep-seated ethic about landscapes, reflecting the sense of a stewardship over the land. ... Ethics are one of the pillars of human culture, and land ethics affect both the ways in which we perceive landscapes and how we use landscapes. ... Landscapes have properties that go beyond science. ... Our science at some level reflects these ethical underpinnings." Wiens is in ecology at Colorado State University and currently president of the International Association for Landscape Ecology. (v.10,#3)

Wiens, John A. "Oil, Seabirds, and Science." Bioscience 46, no.8 (1996): 587. The effects of the Exxon Valdez oil spill. When an environmentalist accident creates a potential conflict between science and environmental advocacy, science may suffer. Scientists, like the general public, expect the worst, and tend to interpret data accordingly, rather than to assume a null hypothesis, since "common sense" tells us that a big spill must have bad results. This was further complicated, in the Valdez spill, by much natural variation in the seabird populations. Subsequent studies indicate that seabirds recovered much faster than some scientists predicted. With critical exchange BioScience 46(1996):794, and 47(no. 2, 1997):66-67, and 47(no. 4, 1997):202-206. Wiens teaches ecology at Colorado State University. (v7, #3)

Wiepkema, P. R., Schouten, W.G.P., and Koene, P., "Biological Aspects of Animal Welfare: New Perspectives", Journal of Agricultural and Environmental Ethics 6(1993). Supplement. Basically vertebrates are organisms that collect, store and implement information in a cognitive way. This characteristic implies that changes in predictability/controllability (P/C) of relevant events strongly influence present and future behaviour. In cases of decreases of P/C stress symptoms appear. Individual vertebrates differ in their coping styles. Moreover, they show changes in P/C or certainty by means of emotional expressions. Finally, individuals that form a stable social group may significantly protect each other against stress. Animal friendships are a likely phenomenon. Wiepkema, Schouten, and Koene are in the Department of Animal Husbandry Ethology, Agricultural University, Wageningen, The Netherlands.

Wiggins, David, "Nature, Respect for Nature, and the Human Scale of Values," Proceedings of the Aristotelian Society 100 (no. 1, 2000):1-31. Leibniz supposed that the world grows ever more aesthetic with the human development of it, but environmentalists lament the vanishing of natural or wild elements of the landscape, which they treasure. Philosophers might fear that such values are too speculative, mystical, or romantic. Perhaps these lamented values are valued only because they are constitutive of larger human interests. But the human scale of values is not uniformly human centered. We cherish natural things for reasons that transcend utility, profit, human welfare. The swallow, the skylark, the wetland, the water meadow--these things matter to us, but we should "pay attention to the way in which they matter to us": they matter "by virtue of a pre-existing engagement with such things that is independent of our pursuit of our own content or happiness" (p. 11).

Economists are unable to account for such values in their terms. The value here is not only a matter of sustainability, though "every departure from sustainable policies has to be justified in terms of dire vital need" (p. 18). The central value is one already noted by Mill: "Nor is there much satisfaction in contemplating the world with nothing left to the spontaneous action of Nature" (p. 22) (and contrary to Leibniz).

We require analysis of the idea of nature. The contrast between nature and culture is important (even if humans are in other senses natural). Nature is multi-faceted and produces various responses (gratitude, awe, disconcertment, disgust, fear); a philosophical puzzle now is what to make of "respect for nature," especially if one is not religious but secular. One form of respect is nature as a redoubtable opponent or a force to be reckoned with, a limitation upon our will, by which we might gain a better understanding of the scale of our humanity. This would make us duly precautionary, but more: Perhaps we do well to respect nature as "the aggregate of the powers and properties of all things" (Mill). Wiggins is at New College, Oxford, and this was the presidential address to the Aristotelian Society, London, October 1999. (v.13, #3)

Wightaxling (Wight-axling), Heather, "Review of: Federalism in the forest: National Versus State Natural Resource Policy by Tomas M. Koontz," Natural Resources Journal 43(no. 1, 2003): 335-338.

Wigley, Daniel C., Shrader-Frechette, Kristin. "Environmental Justice: A Louisiana Case Study," Journal of Agricultural and Environmental Ethics 9(1996):61-82. The paper begins with a brief analysis of the concepts of environmental justice and environmental racism and classism. The authors argue that pollution--and environment-related decision-making--is prima facie wrong whenever it results in inequitable treatment of individuals on the basis of race or socio-economic status. The essay next surveys the history of the doctrine of free informed consent and argues that the consent of those affected is necessary for ensuring the fairness of decision-making for siting hazardous facilities. The paper also points out that equal opportunity to environmental protection and free informed consent are important rights. Finally, it presents a case study on proposed uranium enrichment facility near Homer, Louisiana and argues that siting the plant would violate norms of distributive equity and free informed consent. It concludes that siting the facility is a case of environmental injustice and likely an example of environmental racism or classism. Keywords: informed consent, equity, fairness, Louisiana, pollution, racism, radiation, rights, uranium. Wigley and Shrader-Frechette teach philosophy at the University of South Florida, Tampa. Wild Duck Review, vol. 3, no. 3, August 1997, is a special issue in tribute to Paul Shepard. Tributes by his wife, Florence Shepard, by Stephen Kellert, Bernie Krause, C. L. Rawlins, Barbara Ras, William Severine Kowinski, Barbara Dean, and Dolores LaChapelle. Wild Duck Review, 419 Spring Street, Suite D, Nevada City, CA 95959. 916/478-0134.

Wild Earth is the periodical of The Wildlands Project, now in volume 6, and is increasingly proving a forum for the discussion of conservation, policy, strategy, ethics, especially involving relatively large areas of wildlands and interconnecting buffers and corridors. Winter 1995/96, vol. 5, no. 4, is a good sample issue. Examples of articles:

Freyfogle, Eric T., "Land Ownership: Private and Wild," pages 71-77. The word property shares etymological roots with such words as proper, appropriate, and propriety. Thus, embedded in the world, if not in today's version of the institution, are certain seemingly inescapable ideas--of rightful scale and proportion, of balance and order, of personal responsibility. To make something one's own--to transform it into one's property--is to make it part of one's life, an extension of one's person and character; it is to bring the thing within the fold of one's individual care and duty. Do these ethical ideas, we might wonder, lurk somewhere beneath the surface of American property law? Freyfogle teaches law at the University of Illinois.

Windsor, Donald A., "Endangered Interrelationships: The Ecological Cost of Parasites Lost," pages 78-83. "Collectively, parasites form a pervasive matrix of interrelationships within an ecosystem which tends to hold it together, acting almost as a glue." Parasites are important regulators of ecosystems, acting almost like complicated servomotors in complex machines. When parasitism is viewed in its larger category, symbiosis, the unifying force is seen as even more comprehensive. "If a single message jumps out from all the myriad details of parasitology, it is that the complex interrelationships among parasites and their hosts are essential to the natural functioning of ecosystems." Required reading for those who

dislike parasites. Windsor is an invertebrate zoologist, Norwich, New York. (v7,#1)

Wild Earth, 13, nos. 2/3, Summer/Fall 2003 is a theme issue, Facing the Serpent, with five articles about human attitudes toward snakes, by E. O. Wilson, Eileen Crist, Harry W. Greene, Reed F. Noss, and Charles Bowden. And another article on mosquitoes. (v.14, #4)

Wild vs. Tame, the pros and cons of game ranching, Bugle: Journal of Elk and the Hunt, vol. 10, no. 3 (Summer 1993):35-43. Jim Posewitz, "The Risks Are Too Great," says no, game ranching commercializes and trivializes hunting, and compromises the integrity both of the wild animal and of the human hunter. Robert D. Brown, "Perception vs. Reality," defends game ranching, selling hunts, as well as game farming, raising game to be slaughtered for the commercial market. Game ranching in many situations preserves the only kind of hunting possible in contemporary, overcrowded America. Posewitz, formerly with the Montana Division of Wildlife, now heads the Cinnabar Foundation, a conservation group. Brown is head of the Department of Wildlife and Fisheries at Texas A & M University. (v5,#1)

Wildavsky, Aaron, But Is It True? A Citizen's Guide to Environmental Health and Safety Issues. Cambridge, MA: Harvard University Press, 1995. \$30. Argues that claims of imminent disaster from global warming and acid rain--but not ozone depletion--are "mostly false, unproven or negligible."

Wildlife Viewing Guides are now available for about half of the U.S. States, and some Canadian provinces, through the Watchable Wildlife Program, with about a dozen partners from the major federal and state (and provincial) agencies, also Defenders of Wildlife. Contact Falcon Press, P. O. Box 1718, Helena, MT 59624. 800/582-2665. Falcon Press is also excellent for various scenic guides, trail guides, biker's guides, and so forth to the countryside.

Wiles, R. David, Neo-Aristotelian Environmental Virtue Ethics. M.A. thesis, Colorado State University, spring 2003. Neo-Aristotelian virtue ethics has recently emerged as an important ethical alternative, challenging Kantianism and utilitarianism for theoretical dominance. This thesis argues that virtue ethics is indeed the best ethical theory available, both generally, and as a grounding framework for environmental ethics. An environmental virtue ethics uniquely recognizes the intricate connections between a healthy environment and human flourishing. It also recognizes the diverse values that nature affords in our quest for eudaimonia, and provides good reason for protecting and preserving these values. Specifically, environmental virtue ethics recognizes the importance of living materially simple lives in our quest for the good life, and stresses the fact that material simplicity is needed to ameliorate the environmental crisis caused by over-consumption. Living close to nature, endorsed by an environmental virtue ethic, facilitates a materially simple lifestyle, which facilitates eudaimonia. Solitary time spent in nature gives us the "mind-time" needed for wisdom. With wisdom, we come to see how truly important nature is for living well. The advisor was Philip Cafaro. Wiles is now a Ph.D. student in the program in religion and nature, University of Florida.

Wilford, John Noble, "Ages-Old Icecap at North Pole Is Now Liquid, Scientists Find," New York Times, August 19, 2000, p. A1, A12. North Pole melted. The ice cap at the North Pole has melted, at least for the present, into a mile wide stretch of open water. Despite their monitoring of warming trends in the Arctic, this took scientists quite by surprise. In recent years, submarines and icebreakers have had to plough through six to nine feet of ice. A tourist cruise there in August found the open water. James J. McCarthy, an oceanographer, a Harvard zoologist, leader of an Intergovernmental Panel on Climate Change, and lecturer on the icebreaker cruise trip, says they are the first humans in history to see open water at the Pole. The last time scientists are certain there was open water at the Pole was 50 million years ago. (v.11,#3)

Wilford John Noble, "Showing Why a Rainforest Matters," New York Times, May 29, 1998. B31, B39. In a new permanent exhibition, the American Museum of Natural History features the interdependence of living things, the wealth of biodiversity, and expresses concern about the future of life on Earth. This is

the Museum's first issues-oriented hall, and puts the Museum forward as an advocate of saving biodiversity through saving ecosystems.

Wilford, John Noble, "In Mongolia, an 'Extinction Crisis' Looms," New York Times, Dec. 6, 2005. Przewalski wild horses have made some comeback, and possibly wolves, but on the whole wildlife is under relentless siege by overhunting and excessive trade in skins and other animal products. There are feeble efforts at control by the government. The sheer size of the country makes it unrealistic to police hunting strictly, and some of the rangers are also involved in the poaching.

Wilford, John Noble, "Tests Suggest Neanderthals Were Hunters, Not Scavengers," New York Times (6/13/00). Neanderthals were hunters not scavengers. New chemical tests on 28,000-year-old Neanderthal bones reveal a diet consisting almost entirely of animal protein. According to several scientists, this strongly suggests that they were accomplished hunters rather than scavengers and foragers. Neanderthals are extinct members of the genus Homo who lived in Europe and were eventually replaced by modern Homo sapiens who arrived there about 40,000 years ago. (v.11,#2)

Texas is mostly private land, but there are landowners willing to piece together packages of wildlands into a cooperative system of wild landscape continuity. Wilhite is a naturalist and writer in the Texas Hill Country and executive coordinator of Hill Country Wild, Austin, TX. (EE v.12,#1)

Wilken, Gene C., Sustainable Agriculture is the Solution, but What is the Problem, Occasional Paper No. 14, Board for International Food and Agricultural Development and Economic Cooperation, Agency for International Development (AID), Washington, D. C. 20523, April 1991. "The concept of sustainability recognizes that agriculture is governed as much by economics as by ecology, by laws of supply and demand as by principles of system maintenance." "Few agroecosystems are ecologically or economically self-contained; most rely on inputs that make them vulnerable to external influences." "The demand to which the world's agroecosystems must respond is made up of two components. Population is not likely to stop growing soon and income may never stop." "The message is clear: The lands and technologies now in use are not adequate to meet present requirements, much less those of the future." "Providing for twice as many people at higher rates of consumption, yet avoiding disastrous impacts on the environment are bold objectives. It is not clear how they will be achieved." Wilken is a geographer at Colorado State University, Fort Collins. (v2,#2)

Wilkinson, Charles F. "Aldo Leopold and Western Water Law: Thinking Perpendicular to the Prior Appropriation Doctrine," Land and Water Review (University of Wyoming, College of Law) 24(1989):1-38. The classic prior appropriation doctrine, "first in time, first in right," mainstay of water law in the West, is bad economics, does not respect the rights of other governments, ignores widely accepted policy objectives, such as maintenance of instream flows and long-term water planning. The classic doctrine is bad science. Leopold's land ethic, though not initially addressing water management policy, is a comprehensive ecological approach to natural resource management and land-use practices, and is directly applicable to water management reform. An ecosystem approach would result in comprehensive watershed resource planning, maximizing societal benefits derived from resource use on a sustainable basis, stability for private water rights, maintenance of water quality, prevention of soil loss, all based on preserving "the integrity, stability, and beauty" of the watershed community. Wilkinson illustrates his claim with efforts on several fronts to move in this direction. (v1,#2)

Willard, L. Duane. "On Preserving Nature's Aesthetic Features." Environmental Ethics 2(1980):293-310. I consider and reject four possible arguments directed against the preservation of natural aesthetic conditions. (1) Beauty is not out there in nature, but is "in the eye of the beholder." I argue that since ingredients of nature cause aesthetic experiences, we cannot justifiably disregard and exploit nature. Preservation of aesthetic conditions is compatible with both objective and nonobjective theories of aesthetic value. (2) Frequent aesthetic disagreements bring about irresolvable disputes concerning which segments of nature to preserve. I claim that these disputes are not irresolvable. Not all disputes about nature's aesthetic values are purely aesthetic disputes: ecological balance, community identity, historic continuity, and economics are relevant; aesthetic experts can help; and such disputes can be put to a vote. (3) Natural beauty is not important compared to nonaesthetic values of nature. I show that this is questionable. Current awareness of environmental problems includes a rapidly growing concern for natural aesthetics. Moreover, even if majority preference is for nonaesthetic uses of nature, this does not settle the question of whether we ought to preserve nature's attractive features. (4) From neither a utilitarian nor a deontological viewpoint do we have an obligation to preserve natural aesthetic conditions for future generations. I argue that even if we do not have a strict obligation, it does not follow that it makes no moral difference whether we preserve. Not yet existing people may have no rights against us, but this does not mean that we do no wrong in polluting and destroying aesthetic conditions of the natural world in which future people will live. Willard is in the department of philosophy and religion, University of Nebraska at Omaha, NE.

Willers, William B., ed., Unmanaged Landscapes: Voices for Untamed Nature. Washington: Island Press, 1999. Unmanaged landscapes are the focus of the struggle to protect and restore wildness, the autonomy of nature, and to allow for its preservation and return on a grand scale. About 40 contributors. Willers is in biology, University of Wisconsin, Oshkosh

Willey, Basil, The Religion of Nature. London: Lindsey Press, 1957. 28 pages, a single lecture, separately printed. Religious experience generated by encounter with nature, especially in William Wordsworth. How far the spectacle of the natural universe has value that is religious or spiritual, and how far the classical injunction to follow nature is valid as a moral maxim. Wordsworth's faith is now regarded as outmoded, but "exploded faiths have a way of coming to life again. ... The religion of Nature, in one form or another, is probably the oldest of all religions." Wordsworth dominated a century in English literature; his attraction to nature is partly in reaction to industrialization, partly a reaction to orthodox Christianity; but there is more. John Stuart Mill's criticism of following nature is effective; in nature "there are no lessons in love, mercy, justice etc.--in fact no morality in the human sense at all." Still, "deep in the human psyche ... there has always lurked an instinct to worship Nature, an instinct perhaps from the remote past of our species." We cannot follow nature morally, but natural things "can give massive satisfaction to certain deep cravings which ... normally remain unfulfilled and unrecognized. ... They remind us that Man is not all, that there is something Other and greater than ourselves, on which we are dependent, and can thus produce an acknowledgement of Being-over-against-us, which is part, though only a part, of religious experience." Sensitive article, worth reading by any who have been stung by Mill's critique in "On Nature." Willey was professor of English literature, University of Cambridge.

Williams, Bruce A., and Albert R. Matheny, Democracy, Dialogue, and Environmental Disputes. New

Haven: Yale University Press, 1995. 272 pages. \$ 32.50. The difficulties faced by environmental regulation are attributed to competing ideas about regulatory legitimacy, resulting from the growth of the American state. The authors propose a more complex and nuanced dialogue between all participants in regulatory policymaking, and apply this to case studies in New Jersey, Ohio, and Florida. (v7,#1)

Williams, Christopher, "Environmental Victims: Arguing the Costs Global Security Programme," Environmental Values 6(1997):3-30. ABSTRACT: The costs of anthropogenic environmental change are usually discussed in broad terms, for example embracing damage to the ecosystem or buildings. There has been little consideration of the direct human dimension of the cost to environmental victims except in clinical terms. In order to prevent and minimise environmental victimisation it seems necessary to present cost arguments to governments and commerce. This paper outlines the personal, social and cash costs of environmental victimisation, using the psycho-social literature, and brief case studies of intellectual disability, road transport and cross-border pollution. It is proposed that governments and commerce might not respond in obvious ways to these cost arguments, but trust is identified as a cost that both may recognise. It is concluded that the concept of loss-costs should be central to any analysis, and the paper provides a framework for comprehensive argument of the costs of environmental victimisation, in the form of a simple matrix. University of Cambridge, Botolph House, 17 Botolph Lane, Cambridge, CB2 3RE, UK. (EV)

Williams, Cindy Deacon, "Sustainable Fisheries: Economics, Ecology, and Ethics," Fisheries 22(no. 2, 1997):6-11. "We have an ethical responsibility as professionals who should know and understand to truly be in communion with nature, not verbally caught up in our description of its parts. We need to be a part of it, be aware, feel that we belong. We must be able to bring our love and passion to efforts to reach a sustainable relationship with the waters of the world and the species that inhabit them" (p. 11). Williams is an aquatic ecologist, Pacific Rivers Council. This was her plenary address to the American Fisheries Society, 1996. (EE v.12,#1)

Williams, Erin E., and Margo DeMello. *Why Animals Matter: The Case for Animal Protection*. Amherst, NY: Prometheus, 2007. Williams and DeMello provide an up-to-date and extensive explication and critique of the meat industry, hunting, the fur and skins industries, the animal experimentation industry, the pet industry, and the animal entertainment industry.

Williams, George H., Wilderness and Paradise in Christian Thought. New York: Harper and Bros., 1962. "We shall find in the positive sense that the wilderness or desert will be interpreted variously as a place of protection, a place of contemplative retreat, again as one's inner nature or ground of being, and at length as the ground itself of the divine being. ... In its negative sense the wilderness will be interpreted as the world of the unredeemed, as the wasteland, and as the realm or phase of punitive or purgative preparation for salvation" (pp. 4-5).

Williams, Hugh, "What is Good Forestry? An Ethical Examination of Forest Policy and Practice in New Brunswick" Environmental Ethics 18(1996):391-410. Public concern for ecological and environmental values is making the job of forest management increasingly complex and uncertain and is gradually undermining the domination of timber value as the primary organizing goal of forest policy. The key question is how to balance the pursuit of short-term economic self-interests with the long-term public good. I articulate a moral theory that affirms the existence of a public good that is understood teleologically as an objective purpose to be pursued. I argue that there is a connection between the philosophical and moral concept of creativity and the scientific concept of biological diversity. I suggest that these concepts are both linked to the political question of the public good. The maximization of the ethical good of creativity according to this theory is linked to the maximization of the public good. In forestry, the management of forest ecosystems in order to maximize their creative good is linked to the maximization of the public good and vice versa. This ethical theory is essentially a religious one in the neoclassical theistic tradition, in which authentic human existence is defined in terms of our relationship to reality and a metaphysically and cosmologically informed world view. (EE)

Williams, Ivor D., and Nicholas V.C. Polunin, "Differences between Protected and Unprotected Reefs of the Western Caribbean in Attributes Preferred by Dive Tourists," Environmental Conservation 27(no.4, Dec. 2000): 382-. (v.12,#3)

Williams, Joy, "The Killing Game," Esquire, October 1990, pp. 112-128. An Esquire style diatribe against hunting. "Why the American hunter is blood-thirsty, piggish, and grossly incompetent." "Hunters kill for play, for the thrill of it." "Sport hunting is immoral. It should be made illegal. Hunters are persecutors who ought to be prosecuted." Williams cites and dislikes Rolston's position on hunting. (v1,#3)

Williams, Joy, "The Inhumanity of the Animal People," Harper's Magazine 295 (August 1997): 60-68. "The animal people are calling for a moral attitude toward a great and mysterious and mute nation, which can't, by our stern reckoning, act morally back. Their quest is quixotic; their reasoning, assailable; their intentions, almost inarticulate. The implementation of their vision would seem madness. But the future world is not this one. Our treatment of animals and our attitude toward them is crucial not only to any pretensions we have to ethical behavior but to humankind's intellectual and moral evolution."

Williams, K. J. H. and Cary, J., "Landscape Preferences, Ecological Quality, and Biodiversity Protection," Environment and Behavior 34(no.2, 2002): 257-74. (v.13,#2)

Williams, Meredith. "Rights, Interests, and Moral Equality." *Environmental Ethics* 2(1980):149-61. I discuss Peter Singer's claim that the interests of animals merit equal consideration with those of human beings. I show that there are morally relevant differences between humans and animals that Singer's rather narrow utilitarian conception of morality fails to capture. Further, I argue that Singer's formal conception of moral equality is so thin as to be virtually vacuous and that his attempts to give it more substance point to just the kind of differences between humans and animals that undermine his equalitarian thesis. Williams is in the philosophy department, Wesleyan University, Middletown, CT. (EE)

Williams, Michael, *Americans and their Forests: A Historical Geography*. New York: Cambridge University Press, 1989. 599 pages. U.S. forest history.

Williams, Michael, *Deforesting the Earth*. Chicago: University of Chicago Press, 2003. Humans deforesting the Earth have wrought in the last hundred years what is surely the most dramatic change in Earth's surface since the end of the Pleistocene 10,000 years ago and what may shortly become the greatest change since the beginning of the Pleistocene over two million years ago. The great majority of this clearing has taken place since 1900 and it has been especially accelerating since 1950.

Humans have long influenced forests, although scholars dispute how significant these influences were. But, despite local influences, generally people really had not put much of a dent in the world's forests as a whole until the last 500 years. Until 1900 the largest impact was in temperate forests, but today the largest impact is on tropical forests. Wood for fuel is part of the picture, but clearing for agriculture is the overwhelming cause. Industrial uses is another factor. There are few visible solutions in prospect for this tangled mess. (v.14, #4)

Williams, Michael, *Americans and their Forests: A Historical Geography*. New York: Cambridge University Press, 1988. Includes significant impacts of Native Americans on the environment. (v8,#3)

Williams, Michael. *Deforesting the Earth: From Prehistory to Global Crisis, An Abridgement*. Chicago: The University of Chicago Press, 2006. This book was first published in 2002 as a landmark study of the history and geography of deforestation. This abridgement retains the original breadth of a survey of ten thousand years to trace anthropogenic deforestation's effects on economies, societies, and landscapes, while making the arguments of the 2002 edition more accessible to the general layperson.

Williams, Nancy M., "Affected Ignorance and Animal Suffering: Why Our Failure To Debate Factory Farming Puts Us At Moral Risk," *Journal of Agricultural and Environmental Ethics* 21(2008):371-384. It is widely recognized that our social and moral environments influence our actions and belief formations. We are never fully immune to the effects of cultural membership. What is not clear, however, is whether these influences excuse average moral agents who fail to scrutinize conventional norms. In this paper, I argue that the lack of extensive public debate about factory farming and, its corollary, extreme animal suffering, is probably due, in part, to affected ignorance. Although a complex phenomenon because of its many manifestations, affected ignorance is morally culpable because it involves a choice not to investigate whether some practice in which one participates in might be immoral. I contend further that James Montmarquet's set of intellectual virtues can provide a positive account of what it means to act as a responsible moral agent while immersed in a meat eating culture; they also represent the moral and epistemic framework for the kind of public discourse that should be taking place. Williams is in the Department of Philosophy, Wofford College, Spartanburg, South Carolina.

Williams, Nigel. "Slow Start for Europe's New Habitat Protection Plan." *Science* 269(1995):320-322. The European Union's Habitats Directive has considerable promise, but nations have been slow to comply with filing their proposed habitat sites, some 169 habitats by a preliminary estimate. The emphasis is on

large conservation areas, which can produce conflicts with development. Good summary of opportunities and problems in Europe. (v6,#3)

Williams, Philip Lee. Crossing Wildcat Ridge: A Memoir of Nature and Healing. Athens, GA: University of Georgia Press, 1999. 240 pp. \$24.95. A counterpoint between Williams' open-heart surgery and contemplative essays on the natural world. (v.10,#1)

Williams, Raymond, "Ideas of Nature," in Problems in Materialism and Culture. London: Verso Editions, 1982. "The idea of nature contains, though often unnoticed, an extraordinary amount of human history. Like some other fundamental ideas which express mankind's vision of itself and its place in the world, 'nature' has a nominal continuity, over many centuries, but can be seen, in analysis, to be both complicated and changing, as other ideas and experiences change" (p. 67). One principal problem is that the term "nature" becomes "singular, abstracted, and personified," as human strive to make sense of their world.

Williams, Sidney B., Jr., "There is Not a Conflict Between Intellectual Property Rights and the Rights of Farmers in Developing Countries", Journal of Agricultural and Environmental Ethics 4(1991):143-150. In a debate: Is there a conflict between intellectual property rights and the rights of farmers in developing countries?

Willis, David J., "Ecophilosophy and Natural Law," Journal of Energy, Natural Resources and Environmental Law (University of Utah College of Law) 12(no. 2, 1996):419-451. "More effort is needed to construct and articulate a coherent ecophilosophy. ... It is particularly vital that attention be focused on the philosophical underpinnings of environmental policy. ... In a philosophical vacuum, we may do little to protect and preserve our conception of the good life" (p. 419, p. 422).

"What we think about and wish for in environmental matters--what we value, both for ourselves and posterity--is the proper business of ecophilosophy and a timely subject for public debate. Natural law is a key element of this approach. ... Ecophilosophy offers such a theory based upon the Gaia hypothesis,

a concept of the earth as a unified biological/geological entity greater than the sum of its parts" (p. 423, p. 424). Willis offers ten principles of natural law: Among them:

"1. The commonwealth of nature constitutes the greater society of which all living beings are members and have a rightful place" (p. 429).

"3. All forms of life have intrinsic as well as utilitarian value, adding to the diversity, health, and richness of the natural commonwealth" (p. 433).

"10. Enlightened self-awareness and action on the part of individuals acts cumulatively to encourage the maturing of human society and bring it into better harmony with the natural order" (p. 449).

Willis a lawyer in Houston, Texas. (v.9,#4)

Willis, K. J., Gillson, L., and Brncic, T. M., "How 'Virgin' is Virgin Rainforest?" Science 304(16 April 2004):402-403. "Evidence has started to emerge from archaeological and paleoecological investigations that many of these so called 'virgin' rainforest blocks might not be as pristine as originally thought and have in fact undergone substantial prehistoric modification." Examples from the Amazon basin, the Congo basin, and the Indo-Malay region of Southeast Asia. But these forest are also resilient and not as fragile as sometimes portrayed; the extent of their regeneration has obscured their earlier modification. "Left for long enough, forest will almost certainly regenerate." The authors also think little biodiversity was lost. With critical response, Science 305(13 August 2004):943-944, the respondents claiming it is unknown whether biodiversity was lost and that no implications follow from this earlier regeneration about whether presently degraded forests, from contemporary logging and agriculture, can similarly regenerate.

Willis, K. G., and J. T. Corkindale, eds., Environmental Valuation: New Perspectives. Wallingford, Oxfordshire, U.K.: C.A.B. International, 1995. Distributed in U.S. by University of Arizona Press. 249 pages. \$ 82.50!!! Cost-benefit analysis, the contrasting approaches of economists and ecologists, the pros and cons of alternative valuation methods, contingent valuation, the transferability of environmental benefit estimates, and the establishment of research priorities. Willis is in town and country planning, University of Newcastle upon Tyne, UK, and Corkindale is with the Environmental Protection Economics Division, Department of the Environment, UK. (v7,#2)

Willis, K. J. and Birks, H. J. B., "What Is Natural? The Need for a Long-Term Perspective in Biodiversity Conservation," Science 314(24 November 2006):1261-1265. Ecosystems change over time and most data available are too short-term to judge natural variability, separating it from human introduced disturbances. Paleoecological records can be used to provide a longer temporal perspective. The use of such records can reduce much of the uncertainty regarding the question of "what is natural." In result, we can start to provide better guidance for long-term management and conservation. One finding is that, when climates change, what these authors call "rear-edge" populations (source populations from which "leading-edge" populations migrate) are extremely important in the conservation of diversity. Willis is at the Long-Term Ecology Laboratory, Oxford University. Birks is in Biology, University of Bergen, Norway.

Willis, K.G., Review of Bjornstad, David J., Kahn, James R., The Continent Valuation of Environmental Resources. (Cheltenham: Edward Elgar, 1996). Environmental Values 6(1997):243-244. (EV)

Willott, Elizabeth, "Restoring Nature, Without Mosquitoes?" Restoration Ecology 12(no. 2, 2004):147-153. Wetlands have many benefits, but have often been drained to help control malaria and other diseases. Mosquitoes pose practical and theoretical problems in restoring wetlands. Abundant mosquitoes is a primary and foreseeable effect of creating habitat suitable for them. But restoration biology often fails properly to address this downside. Willott is in Entomology, University of Arizona, Tucson.

Wills, Christopher et al. (two dozen others), "Nonrandom Processes Maintain Diversity in Tropical

Forests," Science 311 (20 January 2006): 527-531. Tropical forests are often thought to lose diversity over time, due to accidental extinction of rare species, competitive exclusion and other causes. But these authors find that in small patches of tropical forests, rare species often do better than common ones. One reason may be that the common trees, being close together, are more susceptible to deadly infections; such diseases do not spread if trees are rare. Also the rare trees may use resources differently than the common ones, who are starved from over-competition. This suggests that diversity is a self-augmenting process, also that damaged forests may restore their own diversity. Wills is in evolutionary biology, University of California, San Diego.

Wilson, Edward O., "Back from Chaos," Atlantic Monthly 281(no. 3, March, 1998): 41-62. Enlightenment thinkers knew a lot about everything, today's specialists know a lot about a little, and postmodernists doubt that we can know anything at all. The Enlightenment mostly got it right. The fragmentation of knowledge and the chaos in philosophy are not reflections of the real world but artifacts of scholarship. Wilson argues that we can know what we need to know, and that we will discover underlying all forms of knowledge a fundamental unity. Wilson divides what we know, at least about nature and environmental affairs, into four quadrants: environmental policy, environmental ethics, social science, biology. One good test of truth is when many lines of independent evidence converge in support of a claim, a consilience of inductions. Wilson's latest book is Consilience: The Unity of Knowledge (New York: Knopf, Random House, 1998). Wilson is emeritus from comparative zoology at Harvard University.

Another discussion is in the current issue of The Wilson Quarterly, "Is Everything Relative?" where the editors, worried about crippling relativism, put Wilson into debate with Richard Rorty and biologist Paul R. Gross. Contains:

--Wilson, Edward O., "Resuming the Enlightenment Quest," The Wilson Quarterly, Spring 1998, pp. 16-27. Science is the royal road to truth, the cure to the contemporary fragmentation of knowledge, to which philosophers have too much contributed. Wilson's consilience of the sciences--philosophers will want to notice--has now reached the settled conclusion that our human nature, including its morality, is "biased by" the genes. The consilience within biology is expanding to overtake the social sciences and the humanities. The brain is a survival instrument, with Paleolithic survival instincts (p. 20). Fortunately, the biological sciences have figured this out and can correct for it (with what brain, Wilson does not say).

--Rorty, Richard, "Against Unity," pages 28-38. Rorty claims to be more biologicistic than Wilson. Language is a survival tool, as Wilson should know. This means that things are described for various purposes, never for what they are in themselves. "As we pragmatists see it, there can and should be thousands of ways of describing things and people--as many as there are things we want to do with things and people--but this plurality is unproblematic" (p. 30). (But why we should accept Rorty's thousands-plus-yet-one-more view as being better than the rest does become problematic). "My scorn," Rorty continues, "for the claim that a natural scientist gets closer to the way things are in themselves than the carpenter, the moralist, or the literary critic" does mean that "I do indeed think of science as just another way of looking at the world" (p. 38). Rorty is University Professor of Humanities at the University of Virginia.

--Gross, Paul R., "The Icarian Impulse," pages 39-49. Gross defends Wilson; we need to press for consilience as much in ethics as in the sciences, but he is much less sure we are reaching it. Gross is

University Professor of Life Sciences at the University of Virginia, co-author of Higher Superstition (1994), and an editor of The Flight from Reason and Science (1996). (v9,#1)

Wilson, Edward O., "Is Humanity Suicidal?" New York Times Magazine, May 30, 1993. Humans are not exempt from the ecological laws that bind other species. "Human physical and spiritual health depends on sustaining the planet in a relatively unaltered state." (v4,#3)

Wilson, Edward O., Biophilia. Cambridge: Harvard University Press, 1984. Wilson claims, or hopes, that humans have an innate genetic disposition for the love of life, one that can develop into a respect for life, and on which a conservation ethic can be built. A long commentary on this volume is: Kellert, Stephen R. and Edward O. Wilson, eds., The Biophilia Hypothesis (Washington, DC: Island Press, 1993).

Wilson, Edward O., In Search of Nature. Washington, DC: Island Press/Shearwater Books, 1996. 214 pages. Extracts from Wilson's earlier writings, grouped around three themes: Animal Nature, Human Nature; The Patterns of Nature; Nature's Abundance. Sample essays: "Ants and Cooperation"; "Altruism and Aggression"; "The Little Things That Run the World"; "Biophilia and the Environmental Ethic." Wilson is a celebrated conservationist and teaches biology at Harvard University.

Wilson, Edward O., The Future of Life. New York: Alfred A. Knopf, 2002. The twentieth century was a century of unprecedented growth and advance, and also of dark and savage wars. "If Earth's ability to support our growth is finite--and it is--we were mostly too busy to notice. As a new century begins we have begun to awaken from this delirium: "the wreckage of the planet by an exuberantly plentiful and ingenious humanity." Now, increasingly postideological in temper, we may be ready to settle down before we wreck the planet. It is time to sort our Earth and calculate what it will take to provide a satisfying and sustainable life for everyone into the indefinite future. .. The bottom line is different from that generally assumed by our leading economists and public philosophers. They have most ignored the numbers count." Ed Wilson projecting the population and consumption problems onto the biodiversity problems. "The pattern of human population growth in the 20th century was more bacterial than primate." Another problem: "The human brain evidently evolved to commit itself emotionally only to a small piece of geography." So cosmopolitan and biospheric perspectives run counter to our genetic tendencies; but we humans are highly innovative and intelligent. So there is hope. "The issue, like all great decisions, is moral." Reviewed by Norman Myers, Science 295(18 January 2002):447. (v.13,#1)

Wilson, Harry B., "Finding an Ethical Basis for Section 7 of the Endangered Species Act," Journal of Undergraduate Sciences 3(Summer 1996):85-87. Wilson argues that the most likely comprehensive account is that of Holmes Rolston, III. Wilson is a philosophy student, Harvard University.

Wilson, James, "The Savage State," The Ecologist 30(no. 9, Dec. 1, 2000):50. The press regularly uses words like "primitive" and "Stone Age" to describe tribal societies. The media's representation of tribal groups is doing them a disservice. (v.12,#2)

Wilson, James D. and J. W. Anderson, "What the Science Says: How We Use It and Abuse It to Make Health and Environmental Policy," Resources (Resources for the Future, 1616 P. Street, NW, Washington, DC 20036-1400), Summer 1997, Issue 126, pp. 5-8. Science is used and abused by either side in environmental controversies, partly because policy makers and scientists are unwilling to face up to the uncertainties in scientific knowledge, which is often incomplete when decisions must be made. Scientific consensus on environmental issues has often changed back and forth several times. The best assurance of good public policy seems to lie not only in scientific knowledge per se but in open debate, caution, and a regulatory system capable of self correction. Good short article to get these issues under discussion in a classroom. Wilson is a fellow with RFF, and Anderson, formerly with the Washington Post, is a journalist in residence at RFF. (v8,#3)

Wilson, James, "GM Crops: Patently Wrong?" *Journal of Agricultural and Environmental Ethics* 20(2007):261-283. This paper focuses on the ethical justifiability of patents on Genetically Modified (GM) crops. I argue that there are three distinguishing features of GM crops that make it unethical to grant patents on GM crops, even if we assume that the patent system is in general justified. The first half of the paper critiques David Resnik's recent arguments in favor of patents on GM crops. Resnik argues that we should take a consequentialist approach to the issue, and that the best way to do so is to apply the Precautionary Principle, and that the Precautionary Principle, in this case, supports patents on GM crops. I argue that his argument in favor of a consequentialist treatment is invalid; his Precautionary Principle in any case appears to be incompatible with consequentialism; and his conception of reasonable precautions is too ill-defined to have any argumentative purchase. In the second half of the paper, I argue against GM crop patents, on three grounds. First, there is insufficient evidence to say whether allowing patents on GM crops will make research go faster than not having patents, whilst there is a good reason to think that, other things being equal, a society that allows patents on GM crops will be less just than one that does not. Second, even assuming that patents on GM crops will increase the pace of GM crop research, there is no social need to do so. Third, patents on GM crops will frequently have ethically unacceptable side effects. Keywords: Consequentialism - GM crops - intellectual property - precautionary principle - tragedy of the anticommons. Wilson is at Centre for Professional Ethics (PEAK), Keele University, Keele, Staffordshire, UK.

Wilson, Jonathan R. "Evangelicals and the Environment: A Theological Concern," Christian Scholars Review 28(No.2. 1998):298-307. Evangelicals differ in their evaluations of and responses to suggestions that we are in the midst of a world-wide ecological crisis. Wilson uses a dialectic of creation and redemption to provide a theological basis for discussing our differences and correcting our concepts and practices.

Wilson, Michael, Microbial Inhabitants of Humans: Their Ecology and Role in Health and Disease. Cambridge: Cambridge University Press, 2005. You are a community, an ecosystem from the skin in!! More bacteria inhabit your body than you have cells in your body (1014 versus 1013 respectively), far more than there are people on Earth. And you can't live without them; their symbioses are vital to your health (and your health to theirs). Despite occasional pathogens, the process is most often peaceful and mutually beneficial. The land grant universities quickly left farmers behind, in pursuit of technology. "Whereas techne is about making and controlling a world in our own image, agrarianism is about tending to or taking care of a world already given" (p. 899). Wirzba teaches philosophy at Georgetown College, Georgetown, Kentucky. (v.10,#3)

Wirzba, Norman, The Paradise of God: Renewing Religion in an Ecological Age. New York: Oxford University Press, 2004. The doctrine of creation, understood as a statement about the moral and spiritual meaning of the world, actually holds the key to a true understanding of our place in the environment and our responsibility toward it. Our present culture results from a denial of creation that has caused modern problems such as rootlessness, individualism, careerism, boredom, and consumerism. The renewal of the meaning of creation can lead to a renewed sense of human identity and vocation, and happier, more peaceful lives. Wirzba teaches philosophy at Georgetown College, Georgetown, KY.

Wirzba, Norman. "Barnyard Dance: Farming that Honors Animals." *Christian Century* Vol. 124, no. 2 (January 23, 2007): 8-9. Wise, Steven M. "The Legal Thinghood of Nonhuman Animals." Boston College Environmental Affairs Law Review 23, no.3 (1996): 471.

Wise, Steven M., Rattling the Cage: Toward Legal Rights for Animals. Cambridge, MA: Perseus Books, 2000. Foreword by Jane Goodall, who says: "This book can be seen as the animals' Magna Carta, Declaration of Independence, and Universal Declaration of Rights all in one" (p. ix-x). At least some nonhuman animals, the great apes in particular, should be given legal rights, since there is now a tremendous weight of evidence attesting to their higher cognitive capacities. The great apes ought to be considered as "persons." Rights under the law stem not from belonging to a particular species, but from having a certain type of mind, and any definition of mind that encompasses all humans would also include chimpanzees, bonobos and perhaps other species. Wise rejects the utilitarian argument that animal experiments are justified if the human benefits outweigh the cost to animals, because we do not so operate with other humans, persons with minds. With a program for putting such rights into effect in law. Wise is a Boston-based attorney who specializes in animal rights law, and has been visiting lecturer at Harvard Law School.

The editors of Nature Neuroscience remark in an editorial that "the traditional view is that there is an absolute distinction between humans and all other animals, but Wise argues that modern biology has made this obsolete, and that there is no reason why it should remain embodied in law." "Neuroscientists in particular are likely to find themselves on the front lines at some point, given that the animals of greatest interest as models for the human brain are, by definition, the ones for which the case for protection is strongest. It would be unproductive to deny that the arguments raised in Wise's book have some force. Instead, the research community will need to confront them head-on, and to be prepared with good counterarguments. ... They will need to refute its arguments if they are to withstand the legal challenges that appear to be on the horizon." 'Global and ecological justice' (or some variant) is a very popular catchphrase in policy documents, treaties, publications by think-tanks, NGOs and other bodies. I argue that it represents an informal combination of four distinct and sometimes conflicting ideas: global justice, protection of the ecology, sustainability and sustainable growth. To solve the practical, conceptual and logical complications thus caused, a more precise interpretation of global justice and ecological justice is suggested, on the basis of which it is also possible to rank the two and re-interpret the further goals of sustainability and growth. Wittbecker, Alan E. "Deep Anthropology: Ecology and Human Order." Environmental Ethics 8(1986):261-70. Deep ecology has been criticized for being anti-anthropocentric, ignorant of feminism, and utopian. Most of the arguments against deep ecology, however, are based on uncritical use of these terms. Deep ecology places anthropocentrism, feminism, and utopianism into a proper perspective--deep anthropology--which permits understanding of the human relationships with other beings in nature, in a total-field model, without accepting unhealthy extremes. The principles of deep ecology are concerned with creating good places, rather than the "no places" of modern industrial cultures. Wittbecker is at the

Wolf, Clark, "Markets, Justice, and the Interests of Future Generations," Ethics and the Environment 1(no.2, 1996):153-175. This paper considers the extent to which market institutions respond to the needs and morally significant interests of future generations. Such an analysis of the intertemporal effects of markets provides important ground for evaluation of normative social theories, and represents a crucial step toward the development of an adequate account of intergenerational justice. After presenting a prima facie case that markets cannot provide appropriate protections for future needs and interests, I evaluate and reject two of the most promising arguments that purport to rebut this case. None of these arguments is adequate to show that markets will protect the interests of future generations. Given important grounds for pessimism about non-market solutions, this leaves little room for hope that we can successfully preserve productive resources that future generations will need to satisfy their basic needs. However, I tentatively suggest where this hope may reside. Wolf teaches philosophy at the University of Georgia. (E&E)

Wolf, Tom, "The Los Utes Case: Forestry Seeks Its Soul," American Forests November, December 1990. "A badly botched timber sale on the Santa Fe National Forest in New Mexico raises questions about where the ethical soul resides in today's practice of forestry. The agency blundered on the 900-acre Los Utes timber sale and blew it in a fashion that has everyone disturbed. .. Can there--and should there--be an environmental ethic for foresters." "It is simple to say that what happened at Los Utes is wrong, both technically and ethically, but it is difficult to fix responsibility in a way that will result in better performance next time." The area is three miles upstream from Bandelier National Monument. Tom Wolf is an author and forester who has worked for The Nature Conservancy and The Trust for Public Land. (v1,#4)

Wolf, Tom, Colorado's Sangre de Cristo Mountains. Niwot, CO: University Press of Colorado, USA, 1995. 384 pages. \$39.95 cloth. Of interest for its argument that wilderness designation for the Sangre de Cristo mountains, with the richest ecological and cultural diversity from Montana to New Mexico, will result in weaker crucial links between their ecology and the economies of the human communities that surround them. He proposes downsizing the federal management and maintains that the large private ranches in the region are the sites of exciting experiments in creating and maintaining wildlife habitat that tie cultural to biological diversity. Wolf teaches at Colorado College. (v6,#2)

Wolfe, BE; Klironomos, JN, "Breaking New Ground: Soil Communities and Exotic Plant Invasion," BioScience 55 (no. 6, June 2005): 477-488.

As exotic plant species invade ecosystems, ecologists have been attempting to assess the effects of these invasions on native communities and to determine what factors influence invasion processes. Although much of this work has focused on aboveground flora and fauna, structurally and functionally diverse soil communities also can respond to and mediate exotic plant invasions. In numerous ecosystems, the invasion of exotic plant species has caused major shifts in the composition and function of soil communities. Soil organisms, such as pathogenic or mutualistic fungi, have direct effects on the establishment, growth, and biotic interactions of exotic plants. An integrated understanding of how aboveground and belowground biota interact with exotic plants is necessary to manage and restore communities invaded by exotic plant species.

Wolfe, Joan, Making Things Happen: How To Be an Effective Volunteer. Covelo, CA: Island Press, 1991. \$ 22.95 cloth, \$ 14.95 paper. 240 pages. Volunteers are the backbone of grassroots environmentalism, but volunteers are often not as effective as they could be, because they must perform jobs for which they have little or no training. Wolff, Edward N., Top Heavy: A Study of the Increasing Inequality of Wealth in America. New York: Twentieth Century Fund Press (41 East 70th Street, NY, NY 10021; 800/275-1447, 1995. Disquietingly, evidence supports the general conviction that there are diminished prospects for average American citizens. Over the last several years, many studies have established that the working population of the United States--especially men with less than a college education--not only are doing more poorly than their parents, but that their real wages are declining. Between 1947 and 1973, American families in every income category enjoyed income growth--and the poorest families had the highest rate of all. Then,

between 1973 and 1990, average income not only remained almost stagnant, but that average was a reflection of higher income growth for the top 20 percent of families, and a significant fall in real income for the poorest 20 percent. As a result, nearly half the families in American today have lower real income than they did in 1973. In terms of total wealth (distinguished from income), in the 1980's the top 1 percent of wealth holders enjoyed two thirds of all increases in financial wealth. The bottom 80 percent of households ended up with less real financial wealth in 1989 than in 1983. Startlingly, the United States has gone from a position of less wealth inequality among its citizens than in Europe to greater wealth inequality than is found in class-ridden societies. The insecurity that a large segment of the population increasingly faces is shaking the democratic system. Wolff is professor of economics at New York University. (v7,#1)

Wood, Harold W., Jr. "Modern Pantheism as an Approach to Environmental Ethics." Environmental Ethics 7(1985):151-63. While philosophers debate the precise articulation of philosophical theory to achieve a desirable change in environmental attitudes, they may be neglecting the fountainhead of social change. Insofar as ordinary people are concerned, it is religion which is the greatest factor in determining morality. In order to achieve an enlightened environmental ethics, we need what can only be termed a "religious experience." While not denying the efficacy of other religious persuasions, I explore the contribution of an informed modern Pantheism to environmental ethics. The conceptual division of the holy and the world is rectified by pantheism. As a form of "nature mysticism," pantheism promotes a theological basis for achieving oneness with God through knowledge, devotion, and works, all of which establish an enlightened theory for environmental ethics. A modern pantheism bears investigation by those advocating new ethical approaches toward the environment. Wood is founder of the Universal Pantheist Society, Big Pine, CA. (EE)

Wood, Jr., Forrest, "Against Cartmill on Hunting: Kinship with Animals and the Midcentric Fallacy," Philosophy in the Contemporary World 4 (nos. 1 & 2. Spring, Summer, 1997): 56-60. Three recent books offer alternative views of hunting: Matt Cartmill's A View to a Death in the Morning, James Swan's In Defense of Hunting, and Forrest Wood's The Delights and Dilemmas of Hunting. Wood argues, first, that Cartmill's claim of continuity of kind between animals and persons is both overstated and logically disconnected from the hunting/antihunting debate, and, second, that Cartmill's claims that

the suffering of sentient animals is somehow intrinsically undesirable exhibits an unjustified prejudice toward middle-sized organisms. (v9,#1)

Wood Mary Christina. "Fulfilling the Executive's Trust Responsibility Toward the Native Nations on Environmental Issues: A Partial Critique of the Clinton Administration's Promises and Performance," Environmental Law 25(no.3, 1995):733- . Wood analyzes the Clinton Administration's emerging policies to accommodate native interests when implementing environmental and natural resources statutes. She focuses in particular on the trust responsibility in implementing the Endangered Species Act, drawing upon recent regulatory actions affecting treaty fishing in the Columbia River Basin to demonstrate the need for prioritizing tribal interests when regulatory action affects treaty rights. (v6,#4)

Wood, Mary Christina. "Environmental Scholarship for a New Millennium", Environmental Law 26(no. 3):761. Urging students and scholars of environmental law to break the intellectual apathy in this important field, Wood suggests that scholars interested in preventing ecological disaster should take to "millennium scholarship," marked by revealing the environmental crisis, assessing the effectiveness of our legal system, and refocusing on the ethical question of human responsibility toward the earth. Wood is an Associate Professor of Law at University of Oregon School of Law. (v7,#4)

Wood, Paul M., "Biodiversity as the Source of Biological Resources: A New Look at Biodiversity Values," Environmental Values 6(1997):251-268. ABSTRACT: The value of biodiversity is usually confused with the value of biological resources, both actual and potential. A sharp distinction between biological resources and biodiversity offers a clearer insight into the value of biodiversity itself and therefore the need to preserve it. Biodiversity can be defined abstractly as the differences among biological entities. Using this definition, biodiversity can be seen more appropriately as: (a) a necessary precondition for the long term maintenance of biological resources, and therefore, (b) an essential environmental condition. Three values of biodiversity are identified and arranged in a hierarchy: (1) the self-augmenting phenomenon of biodiversity maintains (2) the conditions necessary for the adaptive evolution of species and higher taxa, which in turn is necessary for providing humans with (3) a range of biological resources in the long term. Two broad policy implications emerge: increments of biodiversity should not be traded off against biological resources as if they were the same, and the conservation of biodiversity should be a constraint on the public interest, not a goal in service of the public interest. KEYWORDS: Biodiversity, biological diversity, biological resources, conservation policy, future generations, public interest, sustainability, tyranny of the majority. Faculty of Forestry University of British Columbia, 2357 Main Mall, Vancouver, British Columbia, Canada, V6T 1Z4. (EV)

Wood, Paul M., Biodiversity and Democracy: Rethinking Society and Nature. Vancouver, BC: University of British Columbia Press, 1999. The negative, potentially catastrophic, consequences of biodiversity loss are largely irreversible and the greatest loss will be suffered by future generations. The issue is one of intergenerational justice. Democracies are designed to implement the wishes of the current population. Wood examines a number of contemporary theories of justice and concludes that biodiversity conservation is a legitimate constraint on current collective preference. Biodiversity should be preserved, even if it is not in the current public's best interest to do so. This carries strong implications for constitutional and statutory reform in liberal democracies. Wood is in Forest Resources Management at the University of British Columbia. (v10,#4)

Wood, Paul M. "Intergenerational Justice and Curtailments on the Discretionary Powers of Governments." Environmental Ethics 26(2004):411-428. "Governments of all nations presume they possess full discretionary policy-making powers over the lands and waters within their geopolitical boundaries. At least one global environmental issue the rapid loss of the world's biodiversity, the sixth major mass extinction event in geological time challenges the legitimacy of this presumption. Increment by increment, the present generation is depleting the world's biodiversity by way of altering species'

habitats for the sake of short term economic gain. When biodiversity is understood as an essential environmental condition essential in the long term because it is the source of the biological resources upon which humans depend then the strongly differential distribution of benefits and burdens between generations raises an issue of intergenerational justice. We receive the short-term benefits of economic development; future generations will receive the resulting burden of a biosphere in which one of the life-support systems necessary for humanity will have been compromised. Using Ronald Dworkin's conceptions of distributive justice, it can be demonstrated that constitutional constraints on the discretionary powers of governments, for the sake of intergenerational justice, are entirely consistent with central tenets of liberal democracy. As a result, we should abandon to some extent the presumption that governments have full jurisdiction over the lands and waters within their boundaries.(EE)

Wood, Paul, Review of Alston Chase, In a Dark Wood: The Fight over Forests and the Rising Tyranny of Ecology. Environmental Ethics 20(1998):215-18.

Wood, Paul M. and Laurel Waterman. "Sustainability Impeded: Ultra Vires Environmental Issues." *Environmental Ethics* 30(2008):159-174. Some anthropogenic environmental changes that produce net benefits for the current generation will also produce foreseeable net harms to future generations. Well recognized as "time-lag effects," these changes are environmental issues with strongly differential benefits and burdens between generations. Some of the world's largest environmental issues fall into this category, including biodiversity loss and global climate change. The intractability of these issues for Western governments is not merely a practical problem of avoiding unpopular policy options; it is a theoretical problem for liberal democracy. Current conceptions of political legitimacy authorize governments to act for the benefit of their respective current citizens but not for future generations. A liberal democratic government is not authorized to enact policies for the benefit of future generations if so doing would entail unwanted constraints on the current electorate. To do so would fall beyond the jurisdiction—the legitimate scope of decision making—of government. The result is an entire category of environmental issues that is largely beyond the jurisdiction of government to resolve. These are ultra vires (beyond jurisdiction) environmental issues. To the extent that the concept of sustainability embodies intergenerational justice, then current conceptions of political legitimacy are impeding sustainability. (EE)

Wood-Gush, D. G. M. & Vestergaard, K., "Exploratory Behavior and the Welfare of Intensively Kept animals", Journal of Agricultural Ethics 2(1989):161-169. Exploratory behavior is considered under the following categories: (1) extrinsic exploration in which the animal seeks information about conventional reinforcers such as food, (2) intrinsic exploration which is directed toward stimuli which may have no biological significance, further divided into inspective and inquisitive exploration. Wood-Gush is in agriculture at the University of Edinburgh, Scotland. Vestergaard is in animal production and health at the Royal Veterinary and Agricultural University, Denmark.

Pollution and overfishing have altered numerous marine ecosystems worldwide and have endangered several species. Tougher controls and marine preserves are being proposed. Sources of marine pollution are: Ocean dumping, 10%; Shipping and accidental spills, 12%; Airborne emissions from land, 33%; Runoff and discharges from land, 44%; Offshore mining and oil and gas drilling, 1%. (v8,#3)

Woodgate, Graham, and Redclift, Michael, "From a 'Sociology of Nature' to Environmental Sociology: Beyond Social Construction," Environmental Values 7(1998):3-24. This paper aims to provide some theoretical starting points for constructing a social science approach to environmental issues which goes beyond narrower forms of constructivism without dismissing the importance of interpretative sociology. An ecological understanding of society is compared with the notion of structuration and integrated into the concept of coevolution in order to shed light on the dynamic nature of socio-environmental relations and move beyond the constructivist/realist dualism. KEYWORDS: Coevolution, social construction, socio-environmental relations, structuration. Woodgate is at Wye College, University of London and Redclift is at Keele University. (EV)

Woodroffe, R., S. Thirgood, and A. Rabinowitz, eds., *People and Wildlife: Conflict or Coexistence?* Cambridge: Cambridge University Press, 2005. Human-wildlife conflicts are inevitable if we are to share the planet with other species. Such conflicts will only increase as humans encroach on wildlife areas and, potentially, as wildlife repopulate human-dominated landscapes. Worldwide, this is what is happening now and will continue for some time. Conservation of large carnivores and herbivores is needed to maintain the well-being of the concerned ecosystems and landscapes; they serve a keystone function. But often local people do not think so and reject them because they disturb agriculture. Interestingly, there is more progress in reconciling these conflicts in Europe than in developing nations.

Woods, Abigail, "Why Slaughter? The cultural Dimensions of Britain's Foot and Mouth Disease Control Policy, 1892-2001," Journal of Agricultural and Environmental Ethics 17(2004):341-362. In 1892, the British agricultural authorities introduced a policy of slaughtering animals infected with foot and mouth disease (FMD). This measure endured throughout the 20th century and formed a base line upon which officials superimposed the controversial "contiguous cull" policy during the devastating 2001 epidemic. Proponents of the slaughter frequently emphasized its capacity to eliminate FMD from Britain, and claimed that it was both cheaper and more effective than the alternative policies of isolation and vaccination. However, their discussions reveal that a less obvious but nonetheless important reason for maintaining the slaughter policy was the conviction that in its manner of operation and its outcomes, it

benefited the state and status of the British nation. To its supporters, slaughter was far more than a method of disease control; it acted also as a moralizing and civilizing force, an indicator of veterinary ability and a "virility symbol" of British international leadership. This "cultural" rationale for FMD control by slaughter declined during the late 20th century and was wholly undermined by the 2001 epidemic, when extensive culling failed to convey the intended image of an organized, enlightened Britain. Keywords: agriculture, contiguous cull, foot and mouth disease, history, nationalism, policy, slaughter, vaccination. The author is with the Wellcome Unit for the History of Medicine, Centre for the History of Science, Technology and Medicine, University of Manchester, UK. (JAEE)

Woods, Mark, "Can Wilderness Survive?" From the Center: A Newsletter (The Center for Values and Social Policy, University of Colorado, Boulder), vol. 14, no. 2, Fall 1995. There are mounting criticisms of wilderness. We can circumvent such criticism with a non-anthropocentric wilderness ethic. "Wilderness is meaningful because it is an important repository of value--the value of the free play of natural forces. We cannot avoid impacting nature, but we can choose whether we want to control, dominate, and fully trammel all of nature by living side by side with it and protecting it as wilderness. Academics who claim that there is no such thing as wilderness because the concept is meaningless intentionally or inadvertently support the assault on the physical space of wilderness. Wilderness cannot survive the combined forces of academics who banish it as a meaningless concept and bulldozers that destroy it as a meaningful place. The defense against both is worthwhile." Woods is a PhD candidate at the University of Colorado, Boulder. (v6,#4)

Woods, Mark J. Rethinking Wilderness. PhD thesis, University of Colorado, Boulder, CO, Fall 1996. An examination some of the more important criticisms of wilderness coming from environmental philosophy, ecology, and environmental history. The legal-political practice of wilderness preservation reveals paradoxes about how wilderness is preserved. Recent work in ecology leads us to question whether wilderness can be preserved. Philosophical and historical critiques cast doubt on whether there is any such thing as wilderness to be preserved. We are forced to re-examine the metaphysical and scientific underpinnings and moral values of wilderness, but the arguments advanced against it are all found to be wanting. Three questions steer the discussion: 1. What is wilderness? 2. Why does wilderness have value? 3. How should wilderness be protected? Dale Jamieson was the principal advisor; James Nickel, John Fisher, and Holmes Rolston (Colorado State University) also served on the committee, also Charles F. Wilkinson (University of Colorado Law School). (v7, #3)

Woods, Mark and Paul Veatch Moriarty. "Strangers in a Strange Land: The Problem of Exotic Species," Environmental Values 10(2001):163-191. Environmentalists consider invasions by exotic species of plants and animals to be one of the most serious environmental problems we face today, as well as one of the leading causes of biodiversity loss. We argue that in order to develop and enact sensible policies, it is crucial to consider two philosophical questions: (1) What exactly makes a species native or exotic, and (2) What values are at stake? We focus on the first of these two questions, and offer some preliminary suggestions with regard to the second. Through a series of case studies, we show that it is not always clear whether a species is native or exotic. We identify five possible criteria that could be used for distinguishing natives from exotics. Rather than identifying one of these criteria as the "correct" one, we suggest that the concepts of "native" and "exotic" function more like what some philosophers have called cluster concepts. That is, there are several characteristics that are typical of native species, and a corresponding set of characteristics that are typical of exotic species. None of these characteristics is either necessary or sufficient for identifying a species as either native or exotic. We then identify several of the values that are at stake in dealing with exotic species, and we suggest that policies need to avoid

being overly simplistic. Keywords: Cluster concept, exotic species, invasion biology, native species. Mark Woods is in the Department of Philosophy, University of San Diego, San Diego, CA and Paul Veatch Moriarty is in the EPML Department, Longwood College, Farmville, VA. (EV)

Woods, Mark. "The Nature of War and Peace: Just War Thinking, Environmental Ethics, and Environmental Justice." *Rethinking the Just War Tradition*, Michael W. Brough, John W. Lango, and Harry van der Linden, eds. Albany: State University of New York Press, 2007. Increasing attention today is being paid to the environmental impacts of armed conflicts and military activities - the ecology of war and peace. Most environmental critiques of military activities offer only limited protection, however, because they stem from outsiders looking into matters of war and peace. Woods argues that these critiques can be augmented by building environmental considerations into how western militaries view war and peace from the inside out - via the just war tradition.

"Insect wings ... are proving to be spectacular examples of microengineering. ... The dragonflies ... are supremely versatile, maneuverable fliers, and this is reflected in their wing morphology." A related story is Vogel, Gretchen, "Insect Wings Point to Early Sophistication," Science 282(23 October 1998):599-601. "The insects come equipped with highly engineered wings that automatically change their shape in response to airflow, putting the designers of the latest jet fighters to shame." Well, so much for blind, dumb, stupid evolution. (v.9,#4)

World Bank and the Environment, The. Fiscal 1993. Washington, DC: The World Bank, 1993. (1818 H. Street, N.W. 20433). The fourfold environmental agenda of the World Bank. 1. Assisting countries in environmental stewardship. 2. Assessing and mitigating adverse effects of Bank-financed projects. 3. Building on the positive synergies between development and the environment. 4. Addressing global environmental challenges. (v4,#4)

World Conservation Monitoring Centre (WCMC), The World List of Threatened Trees. Cambridge, UK: World Conservation Press, 1998. ISBN 1 899628 10 X. This report finds that 10% of the world's 100,000 tree species are under threat, naming 976 species that are critically endangered and facing extinction, with many thousands of other species at threat. One such tree is frankincense. The report's grim bottom line is that habitat destruction threatens these trees and for three-quarters of them nothing is being done about it. Only 12% of tree species are in protected areas. Bird Life International published a similar report in 1994 and found that 11% were incidental. This report argues that the similar proportions

are not incidental. A summary is Williams, Nigel, "Study Finds 10% of Tree Species Under Threat," Science 281(4 September 1998):1426. (v.9,#4)

World Development Report 1997--The State in a Changing World. Philadelphia: The World Bank, 1997. \$ 25.95. 354 pages. (The World Bank, P. O. Box 7247-8610, Philadelphia, PA 19170-8619). Also available is the World Development Reports 1978-1997 on CD-ROM. Can an economy flourish without an effective state? No, and here's why. Many states try to do too much with too few resources and little capability. Governments should focus on core public activities that are vital to development. State-led development strategies have often failed. Re-invigorated public institutions need to give public officials the incentive to do their jobs better and to be more flexible, but also to provide restraints to check arbitrary and corrupt behavior. Worm, Boris et al (a dozen others), "Impacts of Biodiversity Loss on Ocean Ecosystem Services," Science (3 November 2006):787-790. Human-dominated marine ecosystems are rapidly losing biodiversity, with unknown consequences, but projections here indicate that the ocean's capacity to provide food, maintain water quality, and recover from perturbations will be lost by 2048. By then all commercial fish and seafood species will be gone, at least in harvestable quantities. Of particular note is the finding that general oceanic biodiversity is required to sustain commercial fisheries. Available data does suggest that these trends are still reversible. The lead author is at Dalhousie University, Halifax, Canada. With commentary: Stokstad, Erik, "Global Loss of Biodiversity Harming Ocean Bounty," Science 314(3 November 2006):745.

Worster, David E. Nature's Economy: The Roots of Ecology. Reviewed in Environmental Ethics 1(1979):177-80.

Worster, Donald, Nature's Economy: A History of Ecological Ideas. 2nd edition. New York: Cambridge University Press, 1994. Features persons whose work was formative in the history of ecology, including Linnaeus, Gilbert White, Darwin, Thoreau, Rachel Carson, Frederic Clements, Aldo Leopold, James Lovelock, Eugene Odum. (v8,#3)

Worster, Donald, "The Ecology of Order and Chaos," Environmental History Review 14(1990):1-18. Classical ecology had much order, equilibrium, harmony, and it was possible to admire such nature, respect it, and form a policy of integrating society with such nature. But recent ecology has seen much disorder, disturbance, perturbation, chaos in natural systems, leaving the puzzling question whether such nature is worthy of respect and preservation. The tendency to see more chaos in ecosystems is part of a larger trend in other sciences--physics, astronomy, chemistry, climatology, mathematics--an interdisciplinary science of chaos. Nature at the system level is often unpredictable, either in principle or too complex to be modeled. But this new tendency to see disorder may not just be discovering objective facts about nature; it may be a projection onto nature of a "post-modernist" ideology about society, believing that societies too are fundamentally erratic. (v1,#3)

Worster, Donald, "Transformations of the Earth: Toward an Agroecological Perspective in History," The Journal of American History 76(1990):1087-1106. The focus of a roundtable discussion by environmental historians, with commentary following, by Alfred W. Crosby, Richard White, Carolyn Merchant, William Cronon, and Stephen J. Pyne, and a final rejoinder, "Seeing Beyond Culture" (pages 1142-1147) by Worster. Various aspects of the debate about whether nature can and ought to be seen with or without cultural filters. "The patterns of nature both do and ought to set a course for our lives--not the only course, or the only possible course, but a reasonably clear pattern that wise societies have followed in the past, foolish ones have scorned" (p. 1145). "One of humankind's oldest intuitions is that the realm of nature has an objective, independent order and coherence; that we are to some extent part of that order, to some extent out of it and opposed to it; that, in any case we ought to respect it" (p. 1146). Worster teaches environmental history at the University of Kansas.

Worster, Donald, "Are We Losing Ground? Environmentalism at the End of the Century," Ethics and the Environment 2(1997):71-79. A presentation at the University of Georgia's forum "Valuing the American Environment," Worster presents a radical viewpoint about the land stating that we need a "new way" to view the world. Worster is in history at the University of Kansas.

Worster, Donald, "Nature and the Disorder of History," Environmental History Review 18(1994)1-15. "Over the past two decades the field of ecology has pretty well demolished Eugene Odum's portrayal of a world of ecosystems tending toward equilibrium, leaving us with no model of development for human society to emulate. ... Nature, we are now told, should be regarded as a landscape of patches of all sizes, textures, and colors, changing continually through time and space, responding to an unceasing barrage of perturbations. Now this is a nature that looks remarkably similar to the human community that Departments of History write about. ... Disturbance is history. And a disturbed nature is a nature that has a history very like the history that humans make. Worster teaches environmental history at the University of Kansas. (v5,#2)

Worster, Donald, The Wealth of Nature: Environmental History and the Ecological Imagination. New York: Oxford University Press, 1993. 255 pp. \$ 25.00. A collection of essays. Past ideas about the relations of humans to nature persist unavailingly into the present. No amount of tinkering will correct what, at root, is a fundamentally obsolete and dangerous world view dependent on the appropriation of nature. Worster wants "to discover a less-reductive, less-ecologically and spiritually nihilistic, less-grasping kind of materialism." With a tinge of fatalism. Worster is a historian at the University of Kansas, Lawrence. (v4,#2)

Worthy, Trevor H., and Holdaway, Richard N., The Lost World of the Moa: Prehistoric Life of New Zealand. Bloomington, IN: Indiana University Press, 2002. In New Zealand, much of the biodiversity crisis is over. People won; native plants and animals lost. Before Polynesians arrived, New Zealand had at least 38 species of birds that could not fly. Of these 29 are now extinct and most of the other 9 are endangered. Including the satellite islands, humans have wiped out about half (70 of 145) of the native species of landbirds, flying or flightless, with most of the losses occurring before the Europeans arrived.

Another finding of interest is that, apart from the human disruption, the vertebrate faunas were rather stable rather than dynamic for the last 100,000 years. On every Pacific island group with a relatively long fossil record, the evidence points to pre-human faunal turnover several orders of magnitude slower than that usually proposed by ecologists, lately enamored of change.

Wouters, Patricia K. "An Assessment of Recent Developments in International Watercourse Law through the Prism of the Substantive Rules Governing Use Allocation", Natural Resources Journal 36(no.2, 1996):417.

Wrangham, Richard, and Dale Peterson, Demonic Males: Apes and the Origin of Human Violence. (New York: Houghton Mifflin, 1996). Chimpanzees are much more violent than their smaller cousins, pygmy chimpanzees or bonobo apes, otherwise quite similar. Chimps live in patriarchal groups in which males regularly rape, beat, and kill, and sometimes drink the blood of their own kind. But bonobos create peaceful societies in which males and females share power. In bonobo groups, female action works to suppress the excesses of male aggression. Females and males are equally important players in bonbo

society. Following this model, human civilization would be more civilized if women seized more political power through elections and used it to counterbalance the male instinct to constantly define "enemies" and attach them. To make this advance, however, women must first abandon a tendency they share with female chimpanzees to reward and select aggressive males as their mates. Bonobo female bonds are often lesbian; Wrangham is reluctant, however to recommend this for human society! Wrangham also claims to have discovered that warfare is not uniquely human, contrary to frequent claims by scientists that war does not occur in other animals. There is a summary story in the Harvard Magazine, January-February 1997, pp. 21-22. Wrangham is a Harvard anthropologist, Peterson is a science writer. (v7,#4)

Wrangham, Richard W., W. C. McGrew, Frans B. M. De Waal, and Paul G. Heltne, eds. Chimpanzee Cultures. Cambridge, MA: Harvard University Press, 1994. 424 pages. \$40. Despite the title, the editors begin by admitting that "cultural transmission among chimpanzees is, at best, inefficient, and possibly absent" (p. 2). This is because there is scant (and in some cases negative evidence) for active imitation or teaching of tool-using techniques. Many cognitive scientists believe that imitation and teaching require the ability to attribute mental states to others. Do chimpanzees consciously model their behavior on that of others, or are they "restricted to private conceptual worlds" (p. 2) If chimpanzees do differ from humans in being unable to attribute intentions, beliefs, and ignorance to others, they will inevitably lack the full capacity to imitate, to inform, and to teach. They will also lack all but the most rudimentary forms of culture. The various authors tackle this question as they are able to, especially with captive animals. (v6,#1)

Wright, Al, "Should the Courts Run the River?" Environmental Law 25 no. 2 (1995): 403- . The courts as managers of the Columbia River.

Wright, Charles Whitmer, Toward an Environmentally Responsive Ethics of Communication (Frankfurt School of Social Theory, Jurgen Habermas, Germany), 1996, State University of New York at Stony Brook a Ph.D. thesis philosophy. 495 pages. First generation members of the Frankfurt School of social theory--Max Horkheimer, Theodor Adorno and Herbert Marcuse--anticipated the need for theoretical reflection concerning the causes of environmental degradation, but their philosophical approach was burdened with serious conceptual difficulties. Jurgen Habermas's reconstruction promises to resolve many of these difficulties. Yet his linguistic and pragmatic approach seems to entail an anthropocentrism that prevents an adequate environmental ethic. This thesis outlines the obstacles facing environmental thinkers in Habermas's conception of practical reason and in his conception of modernity. But his theoretical approach can be reconciled with the aims of environmental ethics and philosophy. A place for a moral dimension to human interaction with the natural world can be secured. The advisor was Kenneth Baynes. (v.10,#1)

Wright, H. E., Jr., et al., eds. Global Climates Since the Last Glacial Maximum. Minneapolis: University of Minnesota Press, 1993. 544 pages. \$59.95. Based on a fifteen-year interdisciplinary study of geological, paleoecologic, and oceanographic evidence. Evidence for climatic changes during the past 18,000 years is summarized, and then the summarized data are compared to paleoclimatic simulations based on models of atmospheric circulation at 300-year intervals. (v5,#2)

Wright, Judith, "Wilderness and Wasteland," Island (Sandy Bay, Tasmania) 42(1990):3-7. Australians have regarded original Australia as wilderness and wasteland, dating from Captain Cook's claiming the eastern part as terra nullius, uninhabited land. Cook knew better, he had in fact been chased off Australia

as a trespasser, and he disobeyed imperial instructions to seek the consent of the natives. Nevertheless, the idea that Australia was uninhabited has continued in law until recently, resulting in unfair treatment of the indigenous peoples there.

Making matters more difficult is the American idea of wilderness, a place without people, now popular in Australia. Wilderness advocates too seek to set aside as wilderness uninhabited land, which are often lands from which indigenous peoples have long since been displaced. So neither those who want to possess uninhabited lands, or those who wish to preserve lands uninhabited have a suitable framework for dealing with the indigenous peoples remaining in Australia. Wright is a poet, a conservationist, and a campaigner for aboriginal rights.

Wright, Justin P.; Jones, Clive G., "The Concept of Organisms as Ecosystem Engineers Ten Years On: Progress, Limitations, and Challenges," BioScience 56 (no.3, March 2006): 203-209 (7). The modification of the physical environment by organisms is a critical interaction in most ecosystems. The concept of ecosystem engineering acknowledges this fact and allows ecologists to develop the conceptual tools for uncovering general patterns and building broadly applicable models. Although the concept has occasioned some controversy during its development, it is quickly gaining acceptance among ecologists. We outline the nature of some of these controversies and describe some of the major insights gained by viewing ecological systems through the lens of ecosystem engineering.

Wright, Nancy C. and Donald Kill, Ecological Healing: A Christian Vision. Maryknoll, NY: Orbis Books, 1993. 161 pages. Paper. Features the Coordination in Development Network (CODEL) of small-scale, environmentally sensitive development projects in developing nations, and how Christians have been and can be catalysts in these projects. Wright is a United Church of Christ minister, Kill is a Columban priest. (v5,#2)

Wright, R. Gerald, ed., National Parks and Protected Areas: Their Role in Environmental Protection. Cambridge, MA: Blackwell Science, 1996. 480 pages. \$ 54.95. National parks are becoming an integral part of preservation efforts on the national and local levels, not as islands of conservation but as integrated into their surrounding ecological and cultural landscapes. Wright is a research biologist for the National Biological Service. (v8,#1)

Wright, R. Gerald, ed. National Parks and Protected Areas. Malden, MA: Blackwell Science, Inc., 1996. 496pp. \$54.95. Focusing on the role and value parks can play in studying and preserving diversity and natural resources, the chapters look into techniques such as evaluating the ecological suitability of lands for parks, restoration of park resources, management of visitor use and protection of biodiversity. (v8,#1)

Wright, Richard T., Environmental Science: Toward a Sustainable Future, 9th edition. Upper Saddle River, NJ: Pearson, Prentice-Hall, 2005. An environmental science textbook with ethics and policy on almost every page. For example, there are sections: What is the Stewardship Ethic? Can Ecosystems Be Restored? The Dilemma of Immigration. The Ethical Dilemma of China's Population Policies. Erosion by Equation (difficulties of measuring the damage of erosion). The Lifeboat Ethics of Garret (sic) Hardin. Showdown in the New West (nuclear wastes). Transfer of Energy Technology to the Developing World. The Rights of Smokers? DDT for Malaria Control: Hero or Villain? "Affluenza": Do You Have It? Stewardship of the Atmosphere. The Tangier Island Covenant (crab and oyster harvesting in the Chesapeake Bay, and a covenant mediated by two churches there). Wright is biology emeritus, Gordon College, Massachusetts.

Wright, Scott D., (University of Utah), Thomas Dietz (George Mason University), Richard Borden (College of the Atlantic), Gerald Young (Washington State University), and Gregory Guagnano (George Mason University), eds., Human Ecology: Crossing Boundaries. Fort Collins, CO: The Society for Human Ecology, 1993. (c/o Jonathan Taylor, U.S. Fish and Wildlife Service, 4512 McMurray Ave., Fort Collins, CO 80525-3400). Paper. \$ 20.00, plus 25% if overseas. Some fifty papers, some long, some short, from the Sixth Conference of the Society for Human Ecology (at Snowbird, Utah). Samples: Andrew Light, "Environmental Pragmatism and Valuation in Nature"; Thomas Webler, "Habermas Put Into Practice: A Democratic Discourse for Environmental Problem-Solving"; Michael S. Brunett, "Valuing the Future as if it Mattered: The Negative Discount Rate and Sustainable Development"; Daniel E. Vasey, "History and Human Ecology: The Strong Principle"; Stirling N. Johnson, "Protecting the Earth, Animals, and Human Health Through a Plant-Based Diet." (v4,#4)

Wright, Will, Wild Knowledge: Science, Language, and Social Life in a Fragile Environment. Minneapolis, MN: University of Minnesota Press, 1992. 240 pages. \$ 14.95 paper. "The ecological problem always seems ... more a profound issue of social order than a strategic issue of legal controls. In many ways it seems to be a problem with our legitimating idea of rationality. Industrial society is based on a political and organizational commitment to the idea of rationality, but as the planet becomes more committed to rationality, in the Enlightenment sense of science and individualism, it also seem to become more irrational, in the ecological sense of sustainability. Rational society seems to be disrupting itself systematically, and if so, then there is a fundamental problem with our legitimating idea of rationality, because this idea is legitimating ecological disaster in the name of reason. If our 'rational' social order is inherently irrational, then we must either give up on it ... or articulate a more coherent idea of rationality, an idea that will legitimate a more ecological and sustainable social order" (p. ix). Wright argues for a "critical commitment to a 'wild' rationality, a rationality that is always external to any established institutional order and thus that is always legitimately available to criticize and disrupt that order. ... It is only through a commitment to a truly 'wild' knowledge that sustainable social institutions can be legitimated" (pp. 218-219). Wright is in sociology at the University of Southern Colorado. (v7,#1)

Wright, Will, Wild Knowledge: Science, Language, and Social Life in a Fragile Environment. Minneapolis: University of Minnesota Press, 1992. 240 pages. Paper, \$ 14.95. "Scientific knowledge ... is primarily an effort at social legitimization and ... its conceptual incoherence as knowledge is now becoming ecological incoherence as social practice." Wright wants to invent a new idea of science by replacing its traditional concept of laws, especially mathematical laws, with a social concept of language. Wright is professor of sociology at the University of Southern Colorado. (v4,#2)

Wuerthner, George and Matteson, Mollie, eds., Welfare Ranching: The Subsidized Destruction of the American West. Washington, DC: Island Press, 2002. Text and photos documenting how grazing is an incredibly destructive form of agriculture. The argument is equally in both. A coffee-table book seems an unlikely venue for a powerful analysis in environmental ethics and policy, but here it is, in the tradition of David Brower.

Wuerthner, George, ed. *Thrillcraft: The Environmental Consequences of Motorized Recreation*. White River Junction, VT: Chelsea Green Publishing Company, 2007. This coffee table size book documents the destructiveness of off-highway motorized craft. It includes over 100 large color photographs and describes and illustrates how jet skis, quads, dirt bikes, dune buggies, snowmobiles, and other motorized recreational craft cause wildlife habitat fragmentation, disturbance of sensitive wildlife, soil erosion, spread of invasive weeds, and land, water, air, and noise pollution. Contents include: (1) "Mind and Machine: A Brief History of Human Domestication" by Tom Butler, (2) "The Twilight of Mechanized Lumpenleisure: An Elegy for Bread, Circuses, and Jet Skis" by James Howard Kunstler, (3) "Off-Road Vehicles and Deep Ecology: Cultural Clash and Alienation from the Natural World" by David Orton, (4) "Teaching Disrespect: The Ethics of Off-Road Vehicle Use on America's Public Lands" by Philip Cafaro, (5) "The Human Cost of Silence Lost: How a Noisy Environment Hurts Our Health" by Richard Mahler, (6) "Fourteen Gardens: Reflections of an Activist" by Rick Bass, (7) "A Wicked Conflict: The Impacts of Motorized Encroachment on Grizzly Bears" by Brian L. Horejsi, (8) "No Wild, No Wildlife: The Threat from Motorized Recreation" by Barrie Gilbert, (9) "Invaders on the Move: Roads and Off-Road Vehicle Use as Major Causes of Weed Invasions" by Jonathan L. Gelbard, (10) "Raging with Machines: Off-Road Vehicles in the Deserts of the Southwestern United States" by Daniel R. Patterson, (11) "Shredded Wildlands: Impacts of Off-Road Vehicles in Alaska" by Ray Bane, (12) "Snowmobiles and Public Lands: Unacceptable Impacts on a Winter Landscape" by D.J. Schubert, (13) "Troubled Waters: Protecting Our Communities and Ourselves from Jet Skis" by Sean Smith and Carl Schneebeck, (14) "Turning the Ship Around: A Victory against All-Terrain Vehicles in Adirondack Park" by Peter Bauer, (15) "Protecting the Path of the Pronghorn: The Motorized Threat to Wildlife Migration Patterns" by Meredith Taylor, and

(16) "Miles from Everywhere: Roads, Off-Road Vehicles, and Watershed Restoration on Public Lands" by Bethanie Walder.

Easley, A. T., Joseph F. Passineau, and B. L. Driver, eds., The Use of Wilderness for Personal Growth, Therapy, and Education, Fort Collins, CO: United States Department of Agriculture, U.S. Forest Service, General Technical Report RM-193. 1990. Two dozen papers from a U.S. Forest Service task force.

Wuerthner, George, "Selfish Genes, Local Control, and Conservation," Wild Earth 9 (No. 4, Wint 1999): 87- . (v.11,#2)

Wuerthner, George, ed., Wild Fire: A Century Of Failed Forest Policy, Published by the Foundation for Deep Ecology by arrangement with Island Press, 2006. Coffee-table size book on the ecological role played by wild fires in forests and how industrial forestry and its supporters have erroneously viewed such fires.

Wuerthner, George, ed. *Thrillcraft: The Environmental Consequences of Motorized Recreation*. White River Junction, VT: Chelsea Green Publishing Company, 2007. Wuketits, Franz M., "Moral Systems as Evolutionary Systems: Taking Evolutionary Ethics Seriously," Journal of Social and Evolutionary Systems 16(1993):251-271. Evolutionary ethics goes beyond mere description. The fact that human behavior is biologically constrained can give rise to some ideas about how to establish moral norms, so that the fact/value distinction in its strict sense is no longer tenable. Taking evolutionary ethics seriously means, after all, looking for possibilities of human beings as a biological species. Biological evolution does not entail any values and moral norms, but in organizing our social life we are well-advised to consider those factors that have channeled our evolution--i.e. not just ask what humans ought to do, but what they are able to do. Moral systems are evolutionary systems. Wuketits is in philosophy of science, University of Vienna, University of Graz, Austria. (v.10,#1)

Wunderlich, Gene, "Agricultural Technology, Wealth, and Responsibility", Journal of Agricultural Ethics 3(1990):21-35. Responsibility as a complement to human rights is presented as a moral alternative to extended, complex systems of animal and ecological rights. This simple idea of responsibility is then applied to four levels of agricultural technology: animal (nature) rights, conservation, organization of agriculture, and people versus planet relationships. The stewardship argument is freed from at least some of the complications of animal rights and ecology, but leaves responsibility with humans to do the right thing. Wunderlich is with the U.S. Department of Agriculture, Washington, D.C.

Wunderlich, Gene, "'Claims to Wealth from Biotechnology", Journal of Agricultural Ethics 1(1988):167-174.

Wunderlich, Gene, "Evolution of the Stewardship Idea in American Country Life," Journal of Agricultural and Environmental Ethics 17(2004):77-93. Theological and secular concepts of stewardship evolved markedly in the 20th century. During this period of evolution, the American Country Life Association through its church, academic, farm organization, and governmental affiliations, served as a bridging and bonding agent in developing the stewardship idea. As in any evolutionary process, the stewardship concept was subjected to a broad array of influences and characterized by notable highlights such as the Lynn Smith critique of the Judaeo-Christian ethic, the man-in-nature statement of Douglas John Hall, and the environmental concerns of ecologists and philosophers of the post-Rachel Carson era. Some gains have been made in understanding the place of humans in nature, but the stewardship idea continues as work in process. Keywords: American Country Life Association, environmental care, Genesis, man-in-nature, nature, stewardship, steward. (JAEE)

Wuthnow, Robert, ed., Rethinking Materialism: Perspectives on the Spiritual Dimension of Economic Behavior. Grand Rapids, MI: William B. Eerdmans, 1995. Ten essays in commentary on our culture's obsession with material goods and the uneasy relation of materialism to religion. "Materialism has gotten out of hand" (p. 3). "Materialism draws us into its logic not so much by convincing us that material goods are preferable to helping the poor, but by persuading us that we can help them best by buying luxury goods for ourselves (thereby creating jobs)" . . . Materialism becomes so much a way of life that we no longer recognize it as an option, as one value among others that we can decide to choose or to reject" (p. 15). Albert Bergesen, in "Deep Ecology and Moral Community," claims that deep ecology provides the only real paradigm shift; the social ecology schools are all anthropocentric. "The emerging ecological theory will also have to have promises for 'all,' except that now the 'all' is more than just humans--it is all living things. Marxism versus liberalism, capitalism versus socialism, patriarchy versus feminism, or the

developed versus the underdeveloped countries--these are simply debates within the human community. This discourse has its place and is important. But it can no longer have the hegemony--in scientific theory or moral discourse--that it has had over the past six hundred years. The era of human-only discourse is at an end. The era of eco-human discourse is just beginning" (p. 208). Bergesen teaches sociology at the University of Arizona. Wuthnow directs the Center for the Study of American Religion, Princeton University. (v6,#4)

Wuthnow, Robert, Poor Richard's Principle. Princeton, NJ: Princeton University Press, 1996. 448 pages. \$ 24.95. Avarice and greed are destroying the American dream. "The quality of human relationships changes significantly when money becomes the underlying principle. Spouses become 'wage earners' or 'investments'; ... parents become 'deep pockets'; friends become 'business contacts.' More significant than these labels, however, are the norms that rise to prominence in fiduciary relations. Money's lack of memory replaces trust with transience. Bargaining becomes more important than sharing. People calculate what to do chiefly in terms of costs and payoffs. The consequences have been documented clearly in experimental psychological research involving children. Observing that young children generally perform acts of kindness and helping naturally, spontaneously, researchers have tried to discover what happens when efforts are made to reinforce this behavior with monetary rewards. Children consistently respond to such rewards by performing good deeds at higher (but only slightly higher) levels than they did before. But when the incentives are removed, the behavior also ceases. Money teaches them that good deeds should not be done spontaneously after all" (p. 197). Wuthnow directs the Center for the Study of American Religion, Princeton University. (v7,#4)

Wynberg, Rachel, "Biodiversity for All: Protecting, Managing and Using South Africa's Biotic Wealth," Africa - Environment and Wildlife 3(no. 1, January-February 1995):33-38. Very useful summary of biodiversity and the present state of its conservation, and threats to it, in South Africa. Wynberg is with the Environmental Evaluation Unit at the University of Cape Town. (v6,#3)

Wynn, Mark, "Beauty, Providence and the Biophilia Hypothesis," Heythrop Journal 38(1997):283-299. Wynn is skeptical about the possibility that any naturalistic theory can account for the full range of human aesthetic responses to nature and uses this point to defend a kind of teleological argument for the existence of God. Wynn is in theology, Australian Catholic University.

Wynn, Mark, "Natural Theology in an Ecological Mode," Faith and Philosophy 16(1999):27-42. The possibility of an alliance between natural theologians and environmental ethicists. Both uphold the goodness of the natural world. The work of Holmes Rolston III can contribute towards the natural theologian's treatment of two issues: the nature and extent of the world's goodness, and the reasons why we may fail to register its goodness fully. The holism and the non-anthropocentrism of Rolston's seminal work throw new light on the values in nature, and on the multiple achievements that are presupposed in any informed appreciation of its goodness. Rolston's work offers a way of broadening traditional philosophical discussions of the problem of evil, in a way that takes account of disvalues which are independent of any hurt done to human beings, and draws attention to the multiple achievements--conceptual, experiential, and (broadly speaking) moral--which are presupposed in any informed response to these issues. Wynn is at the Australian Catholic University, Everton Park (Brisbane).

Wynn, Mark, God and Goodness: A Natural Theological Perspective. London: Routledge, 1999. The world is impressive, and suggests a divine origin, because of its beauty and its openness to the emergence of life, sentience, and mind. The Earth is an integral whole, and its disvalues can best be interpreted in an ecological context. When natural phenomena are considered in their ecosystemic context, nature appears to be neither wasteful, nor cruel, nor blind. It is unsurprising that we often fail to grasp the value of the natural world, because we lack the necessary necessary familiarity with relevant ecological theory. Wynn is in philosophy of religion, Australian Catholic University. (v.12,#3)

Wynne, Clive D. L., Do Animals Think? Princeton, NJ: Princeton University Press, 2004. It may be romantic to think so, but it is not realistic. While animals are by no means dumb, they don't "think" in any way resembling human thinking. Animals have neither the "theory of mind" that humans have (that is, they are not conscious of what others are thinking) nor the capacity for linguistic reasoning. Wynne is in psychology, University of Florida. (v. 15, # 3)

Wynne, Clive D. L., Do Animals Think? Princeton, NJ: Princeton University Press, 2004, 2006. It may be romantic to think so, but it is not realistic. Animals are not dumb, but they do not "think" in our human sense of that word. Animals have neither the "theory-of-mind" capabilities that humans do, nor the capacity for higher-level reasoning. Nevertheless, we ought to respect animal minds. Wynne is in psychology, University of Florida.

Forest values are "relatively enduring conceptions of the 'good' related to forests and forest ecosystems" (p. 44). There has been "a shift in forest values away from easily defined and measured economic values toward values that are much more difficult to measure and that often been neglected or ignored" (p. 55). (v.12,#3)

Xu, Zhi, Bengston, David N. "Trends in National Forest Values Among Forestry Professionals, Environmentalists and the News Media, 1982-1993," Society & Natural Resources 10(1997):43

Xu, Zhi, "Assessing Distributional Impacts of Forest Policies and Projects," Evaluation Review 18 (no. 3, 1994):281-311. Xu develops a model that assesses what he calls "distributional impacts," rather than costs and benefits, or economic impacts, production, and the usual measures. This model integrates monetary and nonmonetary measures of forest policies and projects with attention to who benefits, how much, and optimizing the values carried by forests. Xu is in forest resource policy and economics at the University of Minnesota. (v5,#4)

Xue, Dayuan, and Tisdell, Clem, "Global Trade in GM Food and the Cartagena Protocol on Biosafety: Consequences for China," Journal of Agricultural and Environmental Ethics 15(no. 3, 2002):337-356. The UN Cartagena Protocol on Biosafety adopted in Montreal, 29 January, 2000 and opened for signature in Nairobi, 15-26 May, 2000 will exert a profound effect on international trade in genetically modified organisms (GMOs) and their products. In this paper, the potential effects of various articles of the Protocol on international trade in GMOs are analyzed. Based on the present status of imports of GMOs and domestic research and development of biotechnology in China, likely trends in imports of foreign GM food and related products after China accedes to WTO is explored. Also, China's potential countermeasures to control and regulate imports of GMOs in line with implementation of the Protocol are discussed. China, in recent times, has increased its food and agricultural imports substantially from USA and Canada. China imported soybean 10.42 mill. tons in 2000 and about 15 mill. tons in 2001, of which majority are from USA where GM soybean accounts for 60%. The plantation of US Monsanto's transgenic Bt cotton was increased to more than 1 million ha in China in 2001. Though China has paid great attention to develop biotechnology, it appears to have little scope to export GMOs and GM products. So China may consider a range of administrative measures to implement the Cartagena Protocol and to regulate its import of GMOs and GM agricultural products. Consequently, the Regulation on Safety of Agri-GMOs was issued on June, 2001 and followed three detailed rules issued in Jan. of 2002, with a priority to limit foreign GMOs importing by safety certification and labeling system. These were outlined taking into account policies adopted in Western countries such as green barriers to international trade. KEY WORDS: biosafety, Cartagena Protocol on Biosafety, China, global trade, GMO. Xue is with the Nanjing Institute of Environmental Sciences, State Environment Protection Administration of China, Nanjing, P.R. China. Tisdell is in the Department of Economics, The University of Queensland, Brisbane, Australia. (JAEE)

Yaffee, Steven L., "Three Faces of Ecosystem Management," Conservation Biology 13(no. 4, 1999):713-725. People mean different things when they advocate ecosystem management, here analyzed in three categories: (1) Environmentally sensitive multiple use, (2) An ecosystem approach to resource management, and (3) Ecoregional management. Environmentally sensitive multiple use takes an anthropocentric approach. An ecosystem approach incorporates a biocentric view in which ecosystems are understood as a metaphor for holistic thinking. Ecoregional management takes an ecocentric perspective. The diverse approaches may not be undesirable but sometimes complementary. Yaffee is in the School of Natural Resources, University of Michigan, Ann Arbor.

Yandell, Molly McDonald, Conflict and Consensus in Environmental Ethics and Policy. Colorado State University, M. A. thesis, summer 1999. Bryan Norton's convergence hypothesis states that a consensus among environmentalists is emerging at the most basic level of policy formation, regardless of the diversity of value concerns. This consensus, Norton believes, is capable of healing the fragmented environmental movement and producing environmental policy that will better protect the natural world. The aim of this thesis is to give evidence for the accuracy of Norton's convergence hypothesis. I begin by contrasting John Muir and Gifford Pinchot in order to illustrate the traditional divide that has separated environmentalists into two camps. In the second chapter, I compare the view points of Warwick Fox and E.O. Wilson in order to demonstrate that even with starkly different values, it is possible for environmentalists to agree on basic policy goals. Finally, I argue that Holmes Rolston, III and Bryan Norton also have similar policy goals, regardless of the fact that they do not share the same values. The advisor was Holmes Rolston. (v.10,#2)

Yang, Tongjin, Xifang Huanjing Lunli Sixiang Hanjiu (The Ethical Foundation of Environmental Movements--A Study of Western Environmental Ethics) (in Chinese). Ph.D. thesis at The People's University of China, Beijing, June 1998. The first doctoral dissertation in China studying Western

environmental ethics. The advisor was Luo Guoje, Chair of the Chinese Society of Ethics. Developing an environmental ethics in China requires an analysis of Western environmental ethics. Surveys various types of environmental ethics with detailed analysis of anthropocentric ethics, animal welfare ethics, biocentrism, and ecocentrism. These schools differ in regard to who is morally considerable, a moral patient. Anthropocentrism is necessary but not sufficient. An authentic environmental ethics must embrace animal welfare, biocentrism, and ecocentrism. Confucian and Taoist virtue ethics can provide grounds for harmonizing these differing schools. Virtuous persons express concern for nonhumans as well as for humans. The differing schools become complementary, resulting in a comprehensive and inclusive ethic. Yang continues his research at the Institute of Philosophy, Chinese Academy of Social Sciences, Beijing. He is the translator for a Chinese edition of Holmes Rolston's Environmental Ethics, forthcoming June 1999. (v.9,#4)

Yang Tongjin, Toward A Deep Environmentalism: the Basic Ideas of Environmental Ethics. Chengdu, Sichuan People's Publishing House, 2000, 223 pages. I trace briefly the history of western environmental ethics, and analyze respectively the main four schools of western environmental ethical thoughts: anthropocentrism, animal liberation/rights theory, biocentrism and ecocentrism. I suggest that an authentic environmental ethics must be an open, pluralist environmental ethics, which not only incorporates the wisdom of the four schools, but also tries to transcend their limits. A virtue ethics, especially Confucian ethics and Taoist ethics, can provide a ground for such an environmental ethics. Only such an environmental ethics can provide the most solid ethical foundation for environmentalist movements.

This book, the first that studies western environmental ethical thoughts systematically in China, consists of six chapters: 1. Environmental Ethics: The Spiritual Foundation of Environmentalism. 2. Considering Others: Enlightened Anthropocentrism. 3. Sympathizing With Animals: Animal Liberation/Rights Theory. 4. Valuing Life: Bioegalitarianism. 5. Respecting for Nature: Ecocentrism. 6. Praying for Green: Toward A Deep Environmentalism. Each chapter begins with two cases. In Chinese. (EE v.12,#1)

Yang, Tongjin, "Environmental Ethics in China in Recent Years," *Newsletter, International Society for Environmental Ethics*, vol 19, no. 2, Spring/Summer 2008, pp.29-36. Environmental issues are one of the recent priorities for China. To tackle environmental problems arising from rapid economic growth, China has adopted a series of comprehensive measures since 2000, with marked achievements to its credit. In 2003 the National Coordination Committee on Climate Change was established, and China's National Climate Change Program was formulated, outlining objectives, basic principles, and key areas of actions, as well as policies and measures to address climate change for the period up to 2010. These events are symbols, in some degrees, for the progress China has made in protecting the environment. There has been a fast and steady development of environmental ethics since 2000. Many universities such as Renmin University, Peking University, and Tsinghua University, and institutions such as the Chinese

Academy of Social Sciences, now offer master and doctoral degrees in environmental ethics. In 2003, the Environmental Philosophy Committee of the Chinese National Association of Natural Dialectics was established. Includes recent bibliography.

Yardley, Jim, "Chinese Groups Seek to Halt a Dam and Save a Treasured Place," *New York Times*, October 20, 2004, p. A6. A hydropower dam in one of the world's deepest gorges, Tiger Leaping Gorge, would divert water from the Jinsha River (moving east until it becomes the Yangtze) in the mountainous north section of Yunnan Province to the fast-growing provincial capital, Kunming. The plan would also force the re-location of 100,000 people. The gorge is extremely steep and narrow; at one of the narrowest spots there is a large rock in the center of the river; traditional lore says a tiger leapt from one shore to the rock and to the other shore. The tigers are gone, but the gorge is wild and spectacular, a World Heritage site. Also an editorial, "Saving Shangri-La," *New York Times*, November 9. (This is the region sometimes called Shangri-La, featured in the 1933 novel, *Lost Horizons*. (v.14, #4)

Yates, Scott B. "A Case for the Extension of the Public Trust Doctrine in Oregon," *Environmental Law* 27(no.2, 1997):663. Yates argues that Oregon should apply the public trust doctrine to state water allocation decisions to prevent harm caused to navigable waters by the diversion of water from nonnavigable tributaries. He examines Oregon's public trust case law and water code within the analytical framework utilized by the California Supreme Court in *National Audubon Society v. Superior Court of Alpine County*, and concludes that Oregon law supports extending the public trust doctrine into the appropriation context. (v8,#3)

Yaukey, John, "Studies Suggest Animals Capable of Higher Thought: Recent Research Ignites Debate on Ethics, Cruelty," Gannett News Service story appearing in Gannett Newspapers, e.g. *Fort Collins Coloradoan*, October 4, 1999, A6. New research suggests that animals have much higher levels of cognition and social development than previously thought. But this has to be tested for by ferreting out the kinds of problem-solving tactics animals need to hunt, hide, and survive, by seeing what the animals do naturally and cognitively--rather than with the old-style tests for language or maze-running. One result is that lines blur between those animals that have intelligence and those that do not. Another result is that animal rights/welfare law is tightening up. Harvard and Georgetown law schools have announced they will teach animal rights law. (v10,#4)

Yazzie-Durglo, Victoria, "The Right to Change Tribal Forest Management," *Journal of Forestry* 96(No.11, 1999):33-. Now that Native Americans can manage their land as sovereign nations, tribal councils face the challenge of achieving long-term quality and quantity of timber production while embracing cultural values. Ye, Ping, "On the Structure of Ecological Ethics," Seeking Truth, no. 2 (1992): 39-42. Article in Chinese. The foundation, starting point, and ultimate end of ecological ethics is the coordination of the ongoing relations between humans and nature. To develop an ecological ethics, there must be development of the study of ecological moral philosophy as well as of the study of ecological science. This involves both

fundamental principles and application, theory and practice; it couples attitudes and behaviors, personal norms and personal actions. Both this and the preceding article criticize an exclusively anthropocentric ethics and begin to explore a nonanthropocentric environmental ethics. Ye Ping is professor of philosophy, Northeast Forestry University, Harbin, China. (China)

Yearley, Steve, Cinderby, Steve, Forrester, John, Bailey, Peter, and Rosen, Paul, "Participatory Modelling and the Local Governance of the Politics of UK Air Pollution: A Three-City Case Study, Environmental Values 12(2003): 247-262. In the last decade, many arguments have emerged for encouraging public participation in environmental policy making and management. While some have argued that, in democratic societies, people simply have a right to a participatory role, others base arguments for public participation on the idea that lay people may have access to knowledge which is unknown to officially sanctioned experts. Local people may count as experts about aspects of their neighbourhood or they may have insights into the behaviour of plant operators that is thought to give rise to pollution. This paper reports on a novel empirical approach to analysing and capturing such 'lay' understandings. This technique ('participatory modelling'), developed in ESRC-funded work in the UK, uses community mapping exercises in urban centres to produce spatial representations of local knowledges about air pollution and related problems of noise and odour. In the paper the technique is outlined, presenting data from the three-city case study. The paper concludes by assessing the ways in which participatory modelling can contribute to the local governance of air quality.

Yew-Kwang, Ng, "Intergenerational Impartiality: Replacing Discounting by Probability Weighting," Journal of Agricultural and Environmental Ethics 18(2005):237-257. Intergenerational impartiality requires putting the welfare of future generations at par with that of our own. However, rational choice requires weighting all welfare values by the respective probabilities of realization. As the risk of non-survival of mankind is strictly positive for all time periods and as the probability of non-survival is cumulative, the probability weights operate like discount factors, though justified on a morally justifiable and completely different ground. Impartial intertemporal welfare maximization is acceptable, though the welfare of people in the very far future has lower effects as the probabilities of their existence are also lower. However, the effective discount rate on future welfare values (distinct from monetary values) justified on this ground is likely to be less than 0.1 per annum. Such discounting does not compromise environmental protection and sustainability unduly. The finiteness of our universe implies that the sum of our expected welfare to infinity remains finite, solving the paradox of having to compare different infinite values in optimal growth/conservation theories.

Keywords discounting - environmental ethics - impartiality - intergenerational - intertemporal - probability - sustainable development - welfare. Yew-Kwang is in economics, Monash University, Melbourne, Australia. (JAEE)

Yoon, Carol, "Simple Method Found to Increase Crop Yields Vastly," New York Times (8/22/00): D1. Chinese farmers reduce disease and double crop yields by abandoning monoculture. In one of the largest agricultural experiments ever, thousands of rice farmers in China have abandoned chemical fungicides and controlled rice blast (the most serious disease affecting this crop) by planting a mixture of two different rices instead of a single type of rice as they have typically done. By planting a variety of rice that is resistant to the fungus in rows next to the preferred rice variety (which is susceptible), they blocked the spread of this wind born fungus. As more and more farmers nearby did the same, these positive effects began to multiply across the region. The experiment shows that ecologically based approaches to agriculture can be effective even on a very large scale. It also reinforces the idea that diversity in wild ecosystems is conducive to health as well. (v.12,#2)

Yoon, Carol Kaesuk, "Coping With Supersalmon," New York Times (5/1/00): A1. Frankenfish. A Canadian company has genetically altered Atlantic salmon to produce a growth hormone so they grow twice as fast as normal salmon. The transgenic salmon (with genes from a chinook salmon and an ocean pout) awaits Canadian and U.S. governmental approval before it is grown and marketed commercially. Although concerns about food safety with the fish are low, it is the Food and Drug Administration that will make the decision in the U.S. Critics worry that this agency is ill-equipped to analyze the significant environmental risks associated with widespread growth and marketing of the fish. One worry is that the fast-growing salmon might escape from commercial growing pens and mate with wild fish resulting in "genetic pollution." Furthermore, because females often preferentially mate with larger males, females of wild fish populations might prefer the transgenic males. If such mating produced offspring that did not survive well, the escape of these altered salmon could lead to the extinction of wild fish populations. One possible solution is to sterilize the salmon to be grown in the net pens. Another is to require that the fish only be grown in tanks on land. Anti-biotechnology and consumer groups have affected the public's perception of the health and environmental safety of genetically-altered plants and animals. In Scotland and New Zealand, efforts to develop faster growing salmon were abandoned amid cries of "Frankenfish." The International Salmon Farmers Association, representing the vast majority of salmon farmers worldwide, has taken a strong stand against the new fish. Relatedly, Frito-Lay has decided it would no longer buy biotech corn (a possible threat to monarch butterflies and organic farmers). (v.11,#2)

Yoon, Carol Kaesuk, "Penguins in Trouble Worldwide," New York Times, June 26, 2001, p. D1, p. D2. Populations are declining and evidence is mounting that global warming is a prime cause. Shortage of fish, or krill, leaves the birds starving. Or toxin blooms like a red tide, due to warming, kill the birds. Ten of the world's seventeen species are listed as threatened or endangered. (v.12,#3)

Yoon, Carol Kaesuk, "Biotech Corn Isn't Serious Threat to Monarchs, Draft U.S. Report Finds," New York Times (9/26/00): D4.

Biotech corn may not harm Monarchs. The U.S. Environmental Protection Agency has tentatively concluded that Bt corn (corn genetically modified to produce the pesticide Bt) is unlikely to pose a serious threat to the overall Monarch butterfly population. The agency also downplayed the potential for the insecticide to persist in the soil or to lead to the evolution of pests that can withstand it. The Monarch has recently become a symbol of fragile nature threatened by biotechnology. (v.11,#4)

Yoon, Carol Kaesuk, "As Mt. St. Helens Recovers, Old Wisdom Crumbles," New York Times, (5/16/00). Chance survivors, not orderly succession, the key to recovery on Mt. Saint Helens. Biologists studying the return of life to the slopes of Mt. Saint Helens 20 years after it erupted say that rather than a predictable parade of pioneering species coming in from the edges and altering the environment for the arrival of mid and then late successional species, chance events, including the lucky survival of "biological legacies," is what is shaping the new biota. For example, moles, gophers and ants survived the blast because they were hidden beneath the ground, as did some saplings and shrubs buried in the snow. Roots and bulbs of some wild flowers rode the top of the avalanche and established themselves immediately. These species are playing the crucial role in the recovery of life on Mt. Saint Helens. The findings have implications for forestry where leaving a significant number of trees and deadwood after a harvest will speed the rebirth of a new forest. (v.11,#2)

York, Paul Francis. *Respect for the World: Universal Ethics and the Morality of Terraforming*. Ph.D. Dissertation, University of Queensland, 2005. York provides an examination of the morality of large-scale efforts to transform inanimate parts of nature for example, proposals to terraform Mars. A universal ethics expands the class of entities regarded as morally considerable to include inanimate entities. York builds on the theory of Paul W. Taylor (*Respect for Nature*) and proposes two extensions: (1) an expansion of the scope of moral considerability to include all concrete material objects, and (2) the introduction of the concept of variable moral significance (the notion that all entities have inherent worth but some have more than others). He develops a universal ethics, an ethical framework whose key elements are a fundamental ethical attitude of respect for the world and a principle of minimal harm. Universal ethics regards all concrete material entities, whether living or not, and whether natural or artefactual, as inherently valuable, and therefore as entitled to the respect of moral agents. York concludes that terraforming Mars or any other celestial body at this point in our history would be morally wrong, and he also suggests that universal ethics provides an ethical foundation for efforts to protect Antarctica.

Youatt, R., "Counting Species: Biopower and the Global Biodiversity Census," *Environmental Values* 17(2008):393-417. Biopolitical analyses of census-taking usually focus on human censuses and consider how human experience is shaped by the practice. Instead, this article looks at the proposed global biodiversity census, which aims to take inventory of every species on earth as a response to anthropogenic species extinction. I suggest that it is possible to extend and modify Foucault's concept of biopower to consider contemporary human-nonhuman interactions. Specifically, I argue that an ecologically-extended version of biopower offers a useful way to conceptualise how power circulates in the practices that surround the biodiversity census, and that it points us towards thinking about how analyses of power, authority, and community can consider ecological, rather than purely human, locations and networks.

Young, Crawford, The African Colonial State in Comparative Perspective. New Haven: Yale University Press, 1994. \$ 45. This is the kind of book that those who hope for environmental conservation, environmental justice, and sustainable development in Africa hate to read. Even a cursory glance at postcolonial Africa suggests disaster. Abject poverty, widespread suffering, health crisis, civil wars, displaced populations, murderous and corrupt dictatorships, the collapse of basic infrastructures, and environmental degradation mark much of the region. Young finds colonialism still the culprit. But postcolonial states in Asia, Oceania, and the Americas have fared, on the whole quite differently. Seven distinctive characteristics of the African colonial state account for its virulent legacy: the speed of colonial occupation, the ruthless drive to extract resources from the subjugated societies in order to finance their conquest, the forcing of rural Africans into labor service, a welfare ideology that crippled independence of spirit, a thoroughgoing domination aided by new technologies, a racist ideology that permeated dealings with Africa and denigrated the value of African culture, and--outside Islamic areas--the lack of a religious system that could counter the West's monopolization of the production of meaning and thus the construction of culture. Postcolonial politics inherited the practices and norms of the old, and added destructive and exploitative elements of their own. "The new state was but a derelict reproduction of the old one, unable to perform its functions with the same competence." Can a new state be invented that sheds the debilitating traditions of the past? The outlook is bleak for Africans. And equally bleak for the wildlife. (v7,#2)

Young, R. V., Jr. "A Conservative View of Environmental Affairs." Environmental Ethics 1(1979):241-54. The contemporary debate over the human relation to the natural environment raises many complex issues which have thrown our familiar liberal and conservative political alignments into

disarray. Although ecology is now generally regarded as a liberal cause with conservatives supporting commercial and industrial expansion, until very recently liberals almost unanimously championed industrialization and technological advance. Resistance to "progress" was the folly of only the most eccentric conservatives. Today, both liberal proponents of environmental protection and conservative defenders of business and industry argue on merely prudential grounds: each side maintains that only the adoption of its own program can save human civilization from collapse, or even the race from extinction. Extremely radical environmentalists have based their arguments on moral principle: humanity is just one species among many, and humans are, therefore, morally obligated to respect the rights of other organisms and of the ecosystem as a whole. This position, however, is ultimately reducible to a self-contradictory utilitarianism. It is the reverent attitude of traditional conservatism--that humans are superior to other creatures as the stewards of creation, holding it not as absolute possessor but only in trust from their Creator--that promises both the most moral and the most sensible approach to environmental affairs. Young is in the department of English, North Carolina State University, Raleigh, NC. (EE)

Young, Richard, Healing the Earth: A Theocentric Perspective on Environmental Problems and Their Solutions. Nashville: Broadman and Holman, 1994. Theocentrism, rather than either anthropocentrism or biocentrism, is the only proper stance for Christians to take in environmental ethics. (v9,#2)

Young, Richard Alan, Is God a Vegetarian? Chicago: Open Court, 1999. 187 pages. \$ 20. Sorts through the Bible's many references to animals and diet in order to articulate a Christian account of food. Young's principle is a twist on Socrates: The unexamined meal is not worth eating. The Bible begins and ends with a noncarnivorous creation but in between God explicitly permits meat eating. Jesus eats fish and Paul seems to condemn vegetarianism (1 Timothy 4.13). A good case can be made, however, that vegetarianism is a valid and valuable way of anticipating the kingdom of God by practicing what God most intended for the world. Animal rights and Christian belief. Young teaches New Testament at Temple Baptist Seminary. (v.9,#4)

Young, Thomas. "The Morality of Ecosabotage," Environmental Values 10(2001):385-393. Environmental ethicists rarely discuss the morality of using illegal tactics to protect the environment. Yet ecosabotage (or monkeywrenching) is the topic of numerous articles and books in the popular press. In this paper I examine what I consider to be the three strongest arguments against destroying property as a means of defending the environment: the social fabric argument, the argument for moral consistency, and the generalisation argument. I conclude that none of them provides an a priori obstacle to a consequentialist justification of particular acts of ecosabotage. Then I sketch a version of constrained utilitarianism, which is capable, at least in principle, of justifying some acts of strategic ecosabotage in a democratic society. Keywords: Ecosabotage, justification, argument, consistency, utilitarianism. Thomas Young is in the Philosophy Department Mansfield University, Mansfield, PA, USA. (EV)

Yu, Mouchang, "Ecoethics: The Moral Philosophy of Foresters" (in Chinese) in Journal of Beijing Forestry University, No. 4, 1992. Beijing Forestry University Press, Beijing, 1992. The traditional pattern in forestry is characterized by a high output of commodity production from forests. But according to ecoethics, forests are valuable in diverse ways. They should be valued not only in terms of economics but also in terms of ecology, aesthetics, and ethics. Ecoethics offers new viewpoints from which to understand forests and forestry and new ways to orient research. Ecoethics can be used as a working philosophy for forest researchers. Hence it provides valuable ideas for the transition from the traditional economic patterns of forestry to a new forest management that seeks to optimize multiple values. Yu Mouchang is with the Institute of Philosophy, Chinese Academy of Social Sciences, Beijing. (China)

Yu, Mouchang, Sheng Tai Xue De Xin Xi (Ecological Information) Shenyang (in Liaoning Province): Science and Technology Press of Kiaoning Province, 1982). Written for a popular audience to introduce some fundamental ecological ideas, at a time when ecology was a new subject in China. (China)

Zaidi, Iqtidar H. "On the Ethics of Man's Interaction with the Environment: An Islamic Approach." Environmental Ethics 3(1981):35-47. I argue that Islam provides very efficient ethical principles for dealing with the present ecological crisis, a crisis rooted in moral deprivation. I reject the maximization of benefits from natural resources without giving due consideration to the adverse environmental impact of such actions, and argue that this practice is based on injustices generated by factors like greed, extravagance, and ignorance, among others. So far, Western solutions of such problems have generally been based purely on materialistic approaches which place emphasis on secular technological models without any linkage with metaphysical doctrines. Islam recognizes that man by virtue of his creation is a superior being, one for the service of whom the Earth was created; but at the same time man has been made responsible for any departure in his behavior from the ways laid down by Almighty Allah. Human activities, according to Islam, must be based on the idea that this world is a transitory abode, and that a human has to gain God's favor in order to be able to find a better place in the other world. Hence, a person's actions, as manifestations of his or her faith, must be properly and effectively administered, requiring justice, Taqwa (piety), and appropriate knowledge and understanding of environmental problems. Zaidi is in the department of geography, University of Karachi, Karachi, Pakistan. (EE)

Zaikowski, Lori A; Garrett, Jinnie M, "A Three-Tiered Approach to Enhance Undergraduate Education in Bioethics", BioScience 54(no.10, 1 October 2004):942-949(8). The systematic integration of ethics into undergraduate programs is a key component to improving the understanding of ethical issues in science for a broad audience. We propose a three-tiered approach to integrating ethics and social issues that can be readily adapted to particular curricular needs. A concerted incorporation of ethics strategically targeted to each level of undergraduate education will improve the preparation of prospective research scientists, enhance K-12 teacher training, increase the scientific and ethical literacy of the general public, and improve the awareness of health professionals regarding ethics in medicine. After examining textbooks,

programs, and faculty perspectives, we suggest areas in which changes can be made to incorporate ethics into undergraduate education.

Zakin, Susan, Coyotes and Town Dogs: Earth First! and the Environmental Movement. New York: Viking, 1993. 483 pages. \$ 23.50. A fast-paced, fact-filled, and thorough history of Earth First! in the 1980's, often irreverent, tough, funny, opinionated, even outrageous, and yet also a thoughtful survey of Earth First! in the context of the broader conservation movement. Earth First!ers liked their "redneck hippie" image; they led the way emphasizing the importance of ecosystems and bioregions, concepts that have since entered the mainstream of environmentalism. Zakin is an environmental writer whose articles have appeared in publications ranging from the New York Times to Mother Jones. (v4,#3)

1986 edition. Zaslowsky is a correspondent for the New York Times; Watkins is editor of Wilderness magazine. (v5,#1)

Zaslowsky, Dyan. "The Battle of Boulder." Wilderness 58 (no. 209, Summer, 1995):25-33. Good intentions combine with contrary expectations to produce a troubling irony. The Boulder Open Space Department has been a pace setter, strongly supported by the populace in land acquisition and preservation--until they began to limit access and move trails in the name of ecosystem conservation and restoration. One observer says: "This is a conflict between social ecologists and deep ecologists. The deep ecologists are the sort of people who lecture us that human society is a cancer on the planet. We social ecologists see ourselves as a part of the natural environment and believe that the footprints of humans have as much right to be on a trail as the footprints of deer and elk." Zaslowsky covers the Rocky Mountain region for the New York Times. (v6,#3)

Zavalkoff, Anne, "Dis-Located in Nature? A Feminist Critique of David Abram," Ethics and the Environment 9(no. 1, 2004):121-139. This paper draws on Mary Daly's creative, connective use of the written word to challenge David Abram's central argument in The Spell of the Sensuous: that alphabetic writing and literacy are primarily responsible both for dulling human sensory perception and for severing a deep connection between humans and the natural world. It does so by outlining Abram's central claim, investigating the parallels and important differences between Abram's and Daly's work, and examining the strategies for reconnecting with the living world that emerge from Daly's prose. Ultimately, this paper argues that the ways in which people interact with all language have a greater impact on their perception of and connection to the natural world than whether they live in oral or literate communities. Zavalkoff is a doctoral candidate in Educational Studies at the University of British Columbia. (E&E)

Zedler, Joy B. et al., "Restoration of Biodiversity, Overview," Encyclopedia of Biodiversity 5: 203-212. Habitats that have lost populations of native species have potential for biodiversity restoration, that is, the return of species-rich conditions. Attempts to restore biodiversity involve multispecies efforts and single-species reintroductions. Genetic issues in biodiversity restoration involve the potential to reduce intraspecific diversity, especially in reintroduce populations of clonal plants and captive-reared animals. The deliberate introduction of nonindigenous species or species not known to occur naturally at a site does not constitute biodiversity restoration. (v.11,#4)

Zeide, Boris, "Another Look at Leopold's Land Ethic," Journal of Forestry 96(1998):13-19. Leopold is universally praised, but his concept of an ecosystem is hardly currently viable. Ecosystems are not so

stable and integrated but more open and chaotic. Nor does he give any help identifying the extent to which humans must and ought to modify ecosystems. His metaphors can be misleading. Zeide is professor of forestry University of Arkansas at Monticello. With commentary by J. Baird Callicott, "A Critical Examination of 'Another Look at Leopold's Land Ethic,'" pp. 20-26. Leopold may indeed need some revision in his concept of an ecosystem, but his main ideas remain valid, that ecosystems are self-organizing systems with considerable regularity and they can be predictably degraded. Economic is not the only consideration managing landscapes, but sustainable ecosystemic processes are important on a healthy landscape. (v9,#1)

China's most ambitious project since the Great Wall, the Three Gorges Dam will displace nearly two million people as it swallows up cities, farms, and the canyons of the Yangtze River. The world's mightiest dam is rising on the Yangtze River. Gains: electric power and flood control. Losses: wild canyons and hundreds of thousands of homes. The pros and cons of this major project, now well into construction. (v9,#1)

Ziegler, Rafael, Review of: Hayward, Tim, Constitutional Environmental Rights. Oxford: Oxford University Press, 2005. Environmental Values 14(2005):530-532.

Ziegler, Rafael, "Political Perception and Ensemble of Macro Objectives and Measures: The Paradox of the Index for Sustainable Economic Welfare," Environmental Values 16(2007): 43-60. Macroeconomic measures and objectives inform and structure political perception in large systems of governance. Herman Daly and John Cobb attack the objective and measure of economic growth in *For the Common Good*. However, their attack is paradoxical: 1) they are in favour of strong sustainability, but construct with the ISEW an index of weak sustainability, and 2) they describe humans as persons-in-community, but propose an index based on personal consumption. While the ISEW has attracted much attention, the same cannot be said about the person-in-community ontology developed at length and prominently in their work. This essay therefore aims to reconstruct Daly and Cobb's criticism of growth from the person-in-community approach. It defends the ISEW as a debunking index that is motivated by the person-in-community approach and the economy-ecology scale problem, and that also engages in the politics of scale. But this does not mean that the ISEW is also a measure of sustainable economic welfare. Critics expecting this kind of sustainability index are likely to see contradictions, but not the critical role the ISEW can play for democratic accountability. Understanding the latter makes it possible to see the ISEW as a step in the evolution of political perception and action. Accordingly the essay is also intended as a contribution to the understanding of this role in a situation where sustainability indices continue to be calculated, and renewed efforts at the measurement of welfare and happiness are made. Ziegler is in the Centre Marc Bloch, Berlin.

Zilney, LA, "Review of: Cohen, Maurie J., and Murphy, Joseph, eds. Exploring Sustainable Consumption: Environmental Policy and the Social Sciences," Society and Natural Resources 16(no.8, 2003):755-758. (v.14, #4)

Ziman, John, "Why Must Scientists Become More Ethically Sensitive Than They Used To Be?" Science 282(4 December, 1998):1813-1814. Such increasing ethical sensitivity is "symptomatic of the transformation of science into a new type of social institution. As their products become more tightly woven into the social fabric, scientists are having to perform new roles in which ethical consideration can no longer be swept aside." In classical science, there could be academic disinterestedness, even ethical neutrality; but science today is increasingly integrated with the pursuit of human interests, often at the level of social forces in industry and finance. "Post-academic science has features that make nonsense of the traditional barriers between science and ethics." Science "cannot brush its ethical problems under the

carpet. Science can no longer be 'in denial' of matters that many of us have long tried to bring to the fore." Ziman, from New Zealand, is in theoretical physics at the University of Bristol, UK, and was long chair of the UK Council for Science and Society. (v.9,#4)

Zimdahl, Robert L., "Ethics in Weed Science," Weed Science 46(1998):636-639. Neither basic nor applied weed science is value free; they are value laden. Most of these values rest on an ethical foundation known as utilitarianism. Weed scientists believe that their work should be useful to humans and promote the greatest good for the greatest number. They ought to enter into public discussion about values at stake in their work. Without embarrassment, weed scientists have to learn to ask about the ethical foundations of their science. Zimdahl is in weed science at Colorado State University. (v. 10, #3).

Zimmer, Carl, "In Give and Take of Evolution: A Surprising Contribution from Islands," New York Times, November 22, 2005. Islands have typically been thought to be dead ends in evolution, but studies now suggest they can at other times be sources from which continents are re-stocked. They are also places where rapid speciation occurs, often because of isolation and specialized environments. This makes islands more important to conserve as reservoirs of biodiversity.

Zimmer, Carl, "Life after Chaos," Science 284(2 April, 1999):83-86. In a special issue of Science on complex systems, with several related articles. "After years of hunting for chaos in the wild, ecologists have come up empty-handed. But the same equations that failed to find chaos are turning up stunning insights into how environmental forces and internal dynamics make populations rise and fall." Although "there is no unequivocal evidence for the existence of chaotic dynamics in any natural population," researchers found that "many were verging on chaos." "To many ecologists, the way nature seems to sit on the edge of chaos, and not plunge deep into it as models predict, is a fascinating puzzle." The studies are reminiscent of those of Stuart Kauffman and his claims that self-organization is stimulated at the edge of chaos. Ecosystems persist in the midst of their perpetual perishing. (v.10,#1)

Zimmer, Carl. "Predicting Oblivion: Are Existing Models Up to the Task?" Science Vol. 317, no. 5840 (17 August 2007): 892-93. Huge numbers of species may be at risk of extinction from climate change, but coming up with precise estimates is proving tough. One method is the climate-envelope model, which analyzes all the places an endangered species is found and looks for features of the climate that those places share. Then the likelihood of global climate change affecting such climates is estimated. But critics worry that the method is inadequate and uncertain.

Zimmerman, Michael E. "Toward a Heideggerian Ethos for Radical Environmentalism." Environmental Ethics 5(1983):99-131. Recently several philosophers have argued that environmental reform movements cannot halt humankind's destruction of the biosphere because they still operate within the anthropocentric humanism that forms the root of the ecological crisis. According to "radical" environmentalists, disaster can be averted only if we adopt a nonanthropocentric understanding of reality that teaches us to live harmoniously on the Earth. Martin Heidegger agrees that humanism leads human beings beyond their proper limits while forcing other beings beyond their limits as well. The doctrine of the "rights of man" justifies human exploitation of nonhuman beings. Paradoxically, however, the doctrine of rights for nonhuman beings does not escape the orbit of humanism. According to Heidegger, a nonanthropocentric conception of humanity and its relation to nature must go beyond the doctrine of rights. We can dwell harmoniously on Earth only by submitting to our primary obligation: to be open for the Being of beings. We need a new way of understanding Being, a new ethos, that lets beings manifest themselves not merely as objects for human ends, but as intrinsically important. Heidegger calls this ethos the "fourfold" of earth and sky, gods and mortals. Humanists argue that Heidegger is wrong to abandon the principle of human rights in favor of the notion that we are obligated to "let beings be," while some radical environmentalists accuse him of being a humanist because he supposedly overestimates the

importance of humankind's ability to speak. Heidegger insists, however, that language makes possible culture, without which there is no human experience of nature. An environmentally sound ethos can arise, according to Heidegger, only from a shift within the cultural heritage of the West. Richard Rorty agrees that we must become open for a new "conversation" with the West, even if this requires abandoning traditionally important fields such as epistemology. The need to develop a new understanding of Being is so great that thinkers from the analytic and continental traditions of philosophy are finally initiating a long-overdue dialogue. For Zimmerman's later position, see: "Rethinking the Heidegger-Deep Ecology Relationship." Environmental Ethics 15(1993):195-224. Zimmerman is in the department of philosophy, Tulane University, New Orleans, LA. (EE)

Zimmerman, Michael E., Callicott, J. Baird, Clark, John, Sessions, George, and Warren, Karen, eds., Environmental Philosophy: Animal Rights to Radical Ecology. Englewood Cliffs, NJ: Prentice Hall, 2000. Now out in a third edition. New features: Mark Sagoff, "Animal Liberation, Environmental Ethics: Bad Marriage, Quick Divorce," which argues that these two important movements cannot be readily reconciled; a rebuttal essay by J. Baird Callicott which argues that animal rights and environmental ethics do have much in common. John Clark, "The Matter of Freedom: Ecofeminist Lessons in Social Ecology." Charles Bliese, "Traditionalist Conservatism and Environmental Ethics." (v.11,#4)

Zimmerman, Michael J., "In Defense of the Concept of Intrinsic Value," Canadian Journal of Philosophy 29(1999):369-410. Intrinsic value, though with a long rich history, including that in G. W. Moore, has come under recent attack. These attacks are unsuccessful, with particular attention to that of Judith Jarvis Thomson. Positive arguments are elusive; nevertheless it seems clear that morally sensitive persons will favor certain things, but not others, for their own sakes. Zimmerman is at the University of North Carolina at Greensboro. (v.12,#3)

Zimmerman, Michael E. "Rethinking the Heidegger-Deep Ecology Relationship." Environmental Ethics 15(1993):195-224. Recent disclosures regarding the relationship between Heidegger's thought and his own version of National Socialism have led me to rethink my earlier efforts [in "Toward a Heideggerean Ethos for Radical Environmentalism." Environmental Ethics 5(1983):99-131] to portray Heidegger as a forerunner of deep ecology. His political problems have provided ammunition for critics, such as Murray Bookchin, who regard deep ecology as a reactionary movement. I now argue that, despite some similarities, Heidegger's thought and deep ecology are in many ways incompatible, in part because deep ecologists--in spite of their criticism of the ecologically destructive character of technological modernity--generally support a "progressive" idea of human evolution. Zimmerman is in the department of philosophy, Tulane University, New Orleans, LA. (EE)

Zimmerman, Michael E. "Feminism, Deep Ecology, and Environmental Ethics." Environmental Ethics 9(1987):21-44. Deep ecologists have criticized reform environmentalists for not being sufficiently radical in their attempts to curb human exploitation of the nonhuman world. Ecofeminists, however, maintain that deep ecologists, too, are not sufficiently radical, for they have neglected the crucial role played by patriarchalism in shaping the cultural categories responsible for Western humanity's domination of Nature. According to eco-feminists, only by replacing those categories--including atomism, hierarchalism, dualism, and androcentrism--can humanity learn to dwell in harmony with nonhuman beings. After reviewing the eco-feminist critique both of reform environmentalism and of deep ecology, I sketch a critical dialogue between eco-feminism and deep ecology. Zimmerman is in the department of philosophy, Tulane University, New Orleans, LA. (EE)

Zimmerman, Michael, Callicott, J. Baird, Sessions, George, Warren, Karen J., and Clark, John, eds., Environmental Philosophy: From Animal Rights to Radical Ecology. 2nd ed. Upper Saddle River, NJ: Prentice-Hall, 1998. 463 pages. The second edition of what has been a very popular anthology in

environmental ethics. Baird Callicott adds an article, "Do Deconstructive Ecology and Sociobiology Undermine Leopold's Land Ethic?" Harold Glasser adds "Demystifying the Critiques of Deep Ecology." Karen Warren revises the introduction to ecofeminism. A section on political ecology includes new essays on free market environmentalism, sustainable development, liberal environmentalism, socialist environmentalism, and ecotage. (v9,#2)

Zimmerman, Michael, Contesting Earth's Future: Radical Ecology and Postmodernity. Berkeley: University of California Press, 1994. 447 pages. Cloth \$30.00. Having once interpreted Heidegger as a forerunner of deep ecology, Zimmerman rethinks his position about deep ecology in particular and radical ecology in general (including ecofeminism and social ecology) in view of recent disclosures of the links between Heidegger's thought and Nazism. To what extent does radical ecology (unwittingly) hold views that are consistent with the reactionary attitudes of fascism? In what respects is radical ecology a dimension of "postmodernity," defined as an epoch that questions the progressive optimism of technological modernity? Zimmerman tries to answer these questions in part by assessing the recent debates among deep ecology, social ecology, and ecofeminism.

Appealing to the work of transpersonal theorist Ken Wilber, who maintains that humankind is taking part in a progressive development of consciousness, of which the ecological crisis is a surmountable symptom, Zimmerman tries to mediate the sometimes bitter dispute between deep ecology and social ecology. Though some ecofeminists maintain that "progressive" ideas justify the domination of emotions, the body, woman, and nature, Zimmerman shows the extent to which ecofeminism can and should acknowledge the "emancipatory" dimension of modernity. Finally, recognizing that radical ecology's hope for a low-tech future may well go unfulfilled, Zimmerman explores "critical postmodern" visions of the future high-tech relation between humanity and nature, including the startling vision contained in Donna Haraway's "Cyborg Manifesto." Zimmerman is in philosophy at Tulane University, New Orleans. (v5,#4)

Zimmerman, Michael, J. Baird Callicott, George Sessions, Karen J. Warren, and John P. Clark, eds., Environmental Philosophy: From Animal Rights to Radical Ecology. Englewood Cliffs, NJ: Prentice-Hall, 1993. Anthology for college use, generally with a good balance of positions. (v4,#3)

Zimmerman, Michael E. "Quantum Theory, Intrinsic Value, and Panentheism." Environmental Ethics 10(1988):3-30. J. Baird Callicott seeks to resolve the problem of the intrinsic value of nature by utilizing a nondualistic paradigm derived from quantum theory. His approach is twofold. According to his less radical approach, quantum theory shows that properties once considered to be "primary" and "objective" are in fact the products of interactions between observer and observed. Values are also the products of such interactions. According to his more radical approach, quantum theory's doctrine of internal relations is the model for the idea that everything is intrinsically valuable because the "I" is intrinsically valuable and related to everything else. I argue that humanity's treatment of nature will become respectful only as humanity's awareness evolves toward nondualism, and that such nondualistic awareness will not be produced by changes in scientific theory alone. Nevertheless, as Callicott suggests, such changes may be harbingers of evolutionary trends in human awareness. I conclude with a sketch of how nondualism, especially in its panentheistic version, provides the basis for environmental ethics. Zimmerman, Michael. Science, Nonscience, and Nonsense. Baltimore, Maryland: The Johns Hopkins

University Press, 1995. pp. \$25.95. Zimmerman begins by showing just what science is--how the criteria of skepticism and falsifiability distinguish it from pseudo-science and mysticism. He offers intelligent, entertaining, and sometimes scathing analyses of bad science--from lottery "systems" and creationism to graphologists and homeopaths, from food and product safety scams to outright scientific fraud. In each case he shows exactly what to watch for--how the most outrageously false claims often contain a grain of truth, and how valid scientific findings may be distorted or selectively quoted to serve the ends of government, business, or special interest groups. Zimmerman is the dean of the College of Letters and Science and professor of biology at the University of Wisconsin, Oshkosh (and therefore is not the philosopher Michael Zimmerman who writes in environmental ethics). Ziner, Karen Lee, "Offshore Harvest of Wind is Proposed for Cape Cod," New York Times (4/16/02): D3. Windmills stir controversy. 170 wind turbines, each the height of a 40 story building, are proposed for Nantucket Sound. They would provide half the electricity for Cape Cod and the islands of Martha's Vineyard and Nantucket (enough power for 500,000 homes and businesses). Advocates argue that harvesting the wind 5 ½ miles off the U.S. coast where there is an "awesome, inexhaustible supply of domestic energy" provides a nonpolluting, renewable, environmentally friendly energy source. Although dozens of wind farms exist in the U.S. and off the coast of Europe, none this large has been built in the U.S. or at sea. Concerns include harm to birds that fly into the turbines, possible effects on fisheries, whether vibrations will affect animals that live on or in the seabed floor, influence these towers might have on ocean currents and radio/T.V. frequencies, and negative consequences for tourism. One opponent argues that "if Nantucket Sound becomes an industrial electrical generation area, then it's no longer a national treasure . . . or wilderness." He also predicts that the turbines will kill so many birds that they will litter the beaches with their bodies. Aesthetics figure in the debate as well. Some claim the 5 by 5 mile grid of carbon-steal turbines each a half mile apart will be ugly; others claim to enjoy looking at wind turbines and see them as "a study in power and grace and a visual testimony to us working with nature."

"As a policy prerogative of the military, a particularly intrusive form of developmentalism is envisaged in Amazonia; civilian allies linked to slash-and-burn cattle ranching, large- and small-scale mining, and massive forestry and agricultural enterprises see themselves, along with the military, as the nationalistic heroes of a nation threatened by ecological imperialism. 'National security' is defined in this context as the colonization of the region: populating, but not democratizing, what they regard as a geopolitical buffer zone." "There is great irony, then, in the apparent attempt by the Brazilian military to seek its salvation by rallying against the ecological 'internationalization' of the Amazon. Military support for the environmentally (and ethically) destructive practices of the status quo promises only to ensure the short-term emergence of yet another ecological and political monoculture." Zuindeau, Bertrand, "Territorial Equity and Sustainable Development," Environmental Values 16(2007): 253-268. The sustainable development (SD) issue is mainly focused on questions of intergenerational equity. The study of intragenerational equity is less common. In this article, I am interested in a particular kind of intragenerational equity, territorial equity. As well as exposing the various territorial inequalities, the literature on SD comprehends territorial equity through possible territorial transfers of sustainability. The reality of these transfers and how to measure them are however, very directly dependent on general conceptions of SD. The text examines analyses that may be inferred from these different ideas. It attempts to reveal the respective limits and to propose a synthesis, which incorporates operational objectives. Zuindeau is in economics and social sciences, University of Lille, France.

Zwart, H.A.E. "The Birth of a Research Animal: Ibsen's The Wild Duck and the Origin of a New Animal Science." Environmental Values 9(2000):91-108.

Abstract: What role does the wild duck play in Ibsen's famous drama? I argue that, besides mirroring the fate of the human cast members, the duck is acting as animal subject in a quasi-experiment, conducted in a private setting. Analysed from this perspective, the play allows us to discern the epistemological and ethical dimensions of the new scientific animal practice (systematic observation of animal behaviour under artificial conditions) emerging precisely at that time. Ibsen's play stages the clash between a scientific and a romantic understanding of animals that still constitutes the backdrop of most contemporary debates over animals in research. Whereas the scientific understanding reduces the animal's behaviour, as well as its environment, to discrete and modifiable elements, the romantic view regards animals as being at one with (or violently disconnected from) their natural surroundings. Keywords: History of animal research, Ibsen (The Wild Duck), animal ethics. H.A.E. Zwart is in the Center for Ethics, University of Nijmegen, PO Box 9103, 6500 HD Nijmegen, The Netherlands. (EV)

Zwart, Hub, "What is an Animal? A Philosophical Reflection on the Possibility of a Moral Relationship with Animals," Environmental Values 6(1997):377-392. ABSTRACT: Contemporary ethical discourse on animals is influenced partly by a scientific and partly by an anthropomorphic understanding of them. Apparently, we have deprived ourselves of the possibility of a more profound acquaintance with them. In this contribution it is claimed that all ethical theories or statements regarding the moral significance of animals are grounded in an ontological assessment of the animals way of being. In the course of history, several answers have been put forward to the question of what animals really and basically are. Three of them (namely the animal as a machine, an organism and a being that dwells in an apparently restricted world) are discussed. It is argued that the latter (Heideggerian) answer contains a valuable starting point for an ethical reflection on recent changes in the moral relationship between humans and animals. Center for Ethics, Catholic University of Nijmegen, 6500 HD Nijmegen, The Netherlands. (EV)

Zwart, Hub, "Environmental Pollution and Professional Responsibility: Ibsen's A Public Enemy as a Seminar on Science Communication and Ethics," Environmental Values 13(2004):349-372. Dr. Stockmann, the principal character in Henrik Ibsen's A Public Enemy, is a classic example of a whistle-blower who, upon detecting and disclosing a serious case of environmental pollution, quickly finds himself transformed from a public benefactor into a political outcast by those in power. If we submit the play to a 'second reading', however, it becomes clear that the ethical intricacies of whistle-blowing are interwoven with epistemological issues. Basically, the play is about the complex task of communicating scientific (notably microbiological) data to lay audiences. This becomes even more apparent when we realise that Stockmann was a contemporary of real 'microbe hunters' such as Pasteur and Koch. The play's basic message is that epoch-making scientists (such as Pasteur and Koch) not only produced convincing and reliable data from a scientific point of view, but also acquired the skills and insights needed to enter into a dialogue with their cultural and societal environment. Zwart is in philosophy and science studies at the University of Nijmegen, The Netherlands. (EV)

Zwart, I., "A Greener Alternative? Deliberative Democracy Meets Local Government," Environmental Politics 12(no. 2, 2003): 23-48.

Zwart, Ivan, "Local Deliberation and the Favouring of Nature," Environmental Values 16(2007): 485-511. The central contention of theories of deliberative democracy is that deliberative arrangements

should encourage (but by no means guarantee) the support of interests that are general to all. Democratic theorists have also suggested that the natural environment will be a likely beneficiary following public deliberation, given the inherent rationality in supporting interests that will lead to the long-term survival of the planet. This paper addresses the question of general environmental interests through two case studies in Australian local government and argues there are at least three factors that affect the ability of notionally deliberative arrangements to deliver outcomes that appear favourable to the natural environment. Zwart is in Community Engagement and Education Land and Fire Management, Department of Sustainability and Environment, East Melbourne, Victoria, Australia.

Zweers, Wim, Participating with Nature: Outline for an Ecologization of our World View. Utrecht, The Netherlands: International Books, 2000. English edition of a work first published in Dutch in 1995. See that entry with English abstract for more detail. (International Books is the English imprint of the Dutch publisher Jan van Arkel. U.S. Distributor: Paul and Company, Publishers Consortium, Inc., 2 Christie Heights St., Leonia, NJ 07605. U.S. price \$ 29.95. UK distributor: Jon Carpenter Publishing, c/o A. Weitzel, 2 Home Farm Cottages, Sandy Lane, St. Paul's Cray, Kent BR5 3HZ.)

Analysis of six basic attitudes to nature: the despot, the enlightened ruler, the steward, the partner, the participant, mystic union. A note on the concept of nature in Dutch nature conservation. Intrinsic value, ecologism, participating with nature. Ecological metaphysics, epistemology in ecological perspective. Ecological aesthetics. Ecological spirituality, including Christianity and ecology. Towards a new connection: ecologism as postmodernism. Zweers was long at the Philosophy Department, Amsterdam University.

Zweers, Wim, Participating in Nature: Outline for an Ecologization of Our World-View [in Dutch]. Utrecht: Uitgeverij Jan van Arkel, 1995. 528 pp. ISBN 90-6224-342-8. Part I: Basic Attitudes Towards Nature (pp. 7-79): 1. The Relevance of Basic Attitudes (Basic Attitudes and Paradigms; Basic Attitudes and Social Structure), 2. A Closer Look at Six Basic Attitudes (Man as Despot; as Enlightened Ruler; as Steward; as Partner of Nature; as Participant in Nature; 'Unio Mystica'), 3. Evaluation and Definition of Standpoints (Anthropocentrism; Reformism; Radicalism; The Role of Government in the Discussion on

Basic Attitudes: Towards a Translation in Policy Terms? (with a digression on the concept of nature in Dutch nature conservation). Part II: Participation and Intrinsic Value (pp. 79-177): 1. The Environmental Crisis and the Opposition Between Man and Nature (From 'Nature' to 'Environment'; The Opposition Between Nature and Culture), 2. 'Ecologism' as the Essential Alternative (Ecological Ethics; Values of Nature: From Instrumental to Intrinsic), 3. The Intrinsic Value of Nature (Basis and Scope of the Concept; Recognition Versus Attribution; Non-differentiability; The Importance of 'Human-ness'), 4. Participating in Nature (Biological; Social-cultural (with a digression on Participating Technology); Psychological). Part III: The Ecological View of Reality (pp. 177-299): 1. 'Deep Ecology' as a Starting Point, 2. Ecological Metaphysics (Totality: Solidarity or Unity?; Dynamics; Meaning and 'Sense'), 3. Epistemology from an Ecological Perspective (Nondualism; Personal Experience; Corporality and Emotionality (with a personal digression on the integration of experiences in piano playing), 4. Experience of Nature and the Concept of Culture (Karl Mannheim's View on Culture; Hermeneutics of Nature), 5. Historical Framework. Appendix: On Ecologism and Feminism (Women 'Closer to Nature?'; Oppression of Women and Exploitation of Nature; The Image of Man (sc.: masc.) from the Perspective of Oppression. Part IV: Varieties of Ecologism (pp. 299-457): 1. The Varieties and the Connections Between Them; 2. The Scientific Variety (Quantum Physics: David Bohm; Biology: Rupert Sheldrake), 3. The Aesthetic Variety (The Aesthetic Attitude: Sensuousness and Contemplativity; Nature as an Aesthetic Object: Art as a Sign of Nature, Nature as a Sign of Art, Towards a Contextual Theory of Natural Beauty), 4. The Spiritual Variety (Introduction: On Spiritual Traditions (with a personal digression on the experience of the starry sky as an amateur astronomer); Ecological Spirituality (Motives, Conceptual Research, Solidarity versus Identification, Self-realization through Solidarity, Solidarity with 'Gaia' (with a personal digression on the experience of mountain climbing and 'trekking'), Christianity and Ecological Spirituality). Part V: Conclusion--Towards a New Alliance: Ecologism as Postmodernism (pp. 457-92): 1. Looking Back, 2. On the Integration of Reflection and Experience, 3. On the Two Cultures, 4. Constructive Postmodernism. Literature, Name Index, Subject Index (pp. 492-528).

Wim Zweers is one of the foremost environmental philosophers in the Netherlands, and has published and edited numerous articles and books in the field. With Wouter Achterberg, during the last decade Zweers has developed this discipline in the Low Countries until it has reached its actual status of being fully recognized by both the academic community and policy-makers alike. This book is his (temporary?) definitive statement on this subject, recapitulating, systematizing, and expanding all he has written before. His position is mostly 'radical' (but not necessarily 'radical ecocentrist') since he stresses the need for a fundamental cultural transformation. In many parts congenial with deep ecological views, Zweers nevertheless has some serious reservations about some aspects of deep ecology. Although influenced by Anglo-American writers like Rolston and Callicott, he maintains a distinctly European-continental approach. (v6,#4)

Zweers, Wim, Participeren aan de natuur: Ontwerp voor een ecologisering van het wereldbeeld [in Dutch: Participating in nature; a design for an ecologized worldview], Utrecht: Jan van Arkel 1995. An English translation is forthcoming. A plea for a participatory philosophy of nature. Zweers has been one of the leading forces behind the rise of environmental philosophy in the Netherlands. (v.11,#1)

Zweierta i my (Animals and Us) is published four times a year in Poland. The current issue (number 1[6]) contains an interview with the chair of the Hunting Management Department of Poznan Agricultural Academy, concerned with a new Polish game law, which moves toward privatizing of hunting and the implications of this for animal welfare. Many wish to open Poland up to more tourist hunting with hunters from other nations in Europe. There is also discussion of a new Polish Animal Welfare Act, currently being considered in the Polish Parliament. There is an article by Jan Wawrzyniak, "Ciemna strona utylizyzmu (The Dark Side of Utilitarianism)." Utilitarianism is a destructive philosophy treating the environment instrumentally as an object to be used for human whims. (v4,#4)

Zwierzeta i my [Animals and Us], a Polish journal devoted to animal welfare issues, published its first

issue, Number 1, in September 1991. The editor and founder is Alina Kasproicz, and a supporting group is the Polish Society for the Prevention of Cruelty to Animals. The editorial statement says that the purpose of the journal is to change present social consciousness and attitudes toward nonhumans and to promote a new way of thinking about the nonhuman environment, a new approach called an ecological conscience. Opening articles include one by a Catholic author and one on law and animals. Jan Wawrzyniak has a short article, "Podstawowe informacje dla obrońców nieludzkich istot żywych" [Basic Information for Defenders of Nonhuman Living Beings], directing Polish readers to many sources available in the West. There will be six issues a year, one in English. Editor's address: ul. Dabrowskiego 25 m 3, 60-840 Poznan. Phone 462-85. (v2,#4)

Zwierzeta i my (Animals and Us) continues to be published as the Polish journal for animal welfare issues. Recent issues are No. 3, with articles on animal abuse issues within Poland, an article on vegetarianism, on Albert Schweitzer's reverence for life philosophy, on zoos and hunting in Poland, and No. 4, with articles on the abuse of geese and ducks to produce fat livers for export to Western Europe, with some translations from Konrad Lorenz's works on geese into Polish, and an article about wolf-reintroduction in Poland and its protection as an endangered species. (Thanks to Jan Wawrzyniak.) (v3,#4)

Zwierzeta i my (Animals and Us), a Polish journal devoted to animal welfare, has now published issue no. 2. Articles on protests against "bloodless" bullfights, on cross country racing of horses over obstacle courses, the first installment of a concise history of animal martyrdom, on pitbulls in Poland, on the ethic of reverence for life in the light of ecology (with particular reference to Albert Schweitzer), on cruelty in business, on slaughtering practices, and on hunting. (v3,#2)

Zwinger, Ann, and Zwinger, Susan, eds., Women in Wilderness. San Antonio, TX: Tehabi Books/Harcourt Brace, 1995. 99 pp. \$ 19.95. Vignettes from adventurous women who crave wild places. Susan Zwinger writes: I go into wilderness to bear the burden of too much beauty. ... There is nothing like the exquisiteness and strength of the natural world. ... it demands both attunement and atonement." Ann Zwinger is a Colorado naturalist, artist, and writer. Susan Zwinger is her daughter, an activist, poet, and environmental writer who lives in Washington State, author of Stalking the Ice Dragon, which chronicled her solitary Alaskan odyssey. (v7,#4)

Zygon: Journal of Religion and Science, "Humanity's Encounter with Nature," is a special issue from December 1989. The issue contains papers from a section on this theme during the conference, "The World Community in Post-Industrial Society, August 21-September 8, 1988 in conjunction with the Seoul Olympiad. Many of the papers are international in orientation. (v1,#1)
